CERTIFICATION:

Engineers Statement:

This attached drainage plan and report for "Bentley Commons" were prepared under my direction and supervision and is correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the City of Colorado Springs/El Paso County for drainage reports and said report is in conformity with the master plan of the Sand Creek Drainage Basin. I accept responsibility for any liability caused by any acts, errors or omissions on my part in preparing this report.

Roger G. Berge 1/15/03
Roger G. Berge, Professional Engineer No. 9646
For and on behalf of Berge-Brewer & Associates, Inc.

Developers Statement:

The developer has read and will comply with all of the requirements specified in this report and plan.

CONDITIONS:

LOCATION AND PURPOSE:

“Bentley Commons” is located in the Northwest Quarter of Section 34, Township 14 South, Range 66 West of the Sixth P. M. in the City of Colorado Springs, El Paso County, Colorado. This 7.8 acre site is zoned R-5 (Multi-family Residential) with the Northeasterly portion having “conditions of record.” The site is proposing to construct condominiums in phases.

The site is bounded on the northeast and southeast by unplatted property. Across Hancock Expressway to the southwest are “Astrozon Place Sub.” and “Astrozon Place Sub. Fil. No. 2”. Across Sand Creek Drainage Way to the northwest is “Pikes Peak Park Sub. No. 13”. The project is located in the Sand Creek Drainage Basin.

SITE CHARACTERISTICS:

This site is presently vacant with mostly grasses and few trees.

SOILS:

The soils in this area consist of Ellicott loamy coarse sand, 0 to 5% slopes (see enclosed soils map). Ellicott Soils are classified as hydrologic group A. A small portion of Off-site Basin 1 may extend into Blakeland soil type, also hydrologic group A, designated with an 8 on the soils map.

METHOD:

This drainage report was prepared in accordance with the latest revision of the City of Colorado Springs/El Paso County “Drainage Criteria Manual” dated November 1991 and amended October 1994. Drainage basins were analyzed using the Rational Method to determine runoff peaks for the 5 year and 100 year storms. The Sand Creek Drainage Basin Planning Study (DBPS) prepared by Kiowa Engineering Corporation and dated 1995 was referenced for this project.

EXISTING DRAINAGE:

The project area drains into the adjacent Sand Creek Drainage Way. An existing concrete channel, that is located mostly within the site boundary, carries stormwater along Hancock Expressway and into Sand Creek. Basin A consists of the site, which includes a portion of the concrete channel. Historic flows for Basin A, established using the current conditions of the site, are $Q_5 = 4.05$ cfs/ $Q_{100} = 10.94$ cfs.

Two (2) off-site drainage basins enter the project area. Off-site Basin 1 was delineated using a combination of the USGS Quadrangle map, the Sand Creek DBPS, and the project contours on the drainage plan. The extent of Off-site Basin 1 is shown on the USGS

Quadrangle map. The stormwater within Off-site Basin 1 flows through the northerly side of the Northeast corner of the project. Off-site Basin 1 historic flows are $Q_5 = 1.36 \text{ cfs}/Q_{100} = 3.40 \text{ cfs}$. The stormwater within Off-site Basin 2 flows through the easterly side of the Northeast corner of the project. Off-site Basin 2 historic flows are $Q_5 = 0.30 \text{ cfs}/Q_{100} = 0.74 \text{ cfs}$.

The existing concrete channel's drainage basins were analyzed in the "Addenda to Drainage Report and Plan, Astrozon Plaza Subdivision" (Astrozon Study) prepared by Leigh Whitehead & Associates dated Sept. 1985. The Astrozon Study sized a culvert to pass the 100 year storm event flowing through the existing concrete channel under Astrozon Boulevard. The study utilized the SCS Method for analysis, no longer used for these sizes of basins. Enclosed is the Astrozon Study's analysis using the Rational Method. The 100 year flow into the existing concrete channel prior to flowing on-site is currently 361.56 cfs, and is expected to be 517.62 cfs under developed conditions.

The Astrozon Study's stormwater runoff areas to the existing concrete channel were confirmed with current topography. Enclosed is a copy of a Facilities Information Management System (FIMS) map with basin overlay from the Astrozon Study. Basin boundaries were adjusted as necessary from the original Astrozon Study. The North system was constructed across Academy Boulevard, across Astrozon Boulevard and to Sand Creek. In addition, a riprap channel was constructed from Jet Wing Drive to the North system's entrance. According to the DBPS, the riprap channel has a $Q_{100} = 110 \text{ cfs}$ and the North system's entrance has a pipe capacity of $Q_{cap} = 150 \text{ cfs}$. The additional research and analysis of the existing concrete channel demonstrated that the channel will pass a 100 year storm event.

The existing concrete channel flows into an existing 58" CMP prior to discharge into the creek. The 58" pipe has the capacity to pass 470.62 cfs, however, due to inlet/outlet control the pipe will discharge 136.36 cfs in the 100 year storm event. Under existing conditions, the existing pipe is expected to discharge 136.36 cfs of the 100 year storm event and overflow the remaining amount, 225.20 cfs, to the existing riprap area. The overflow during the peak of the 100 year storm event will flow Northwesterly through the existing riprap to the creek.

Existing D-10-R curb-opening inlets exist along the North line of Hancock Expressway to the East of the site, as described in this paragraph. On both sides of Boychuk Avenue (extension into commercial parking area) one 6' D-10-R exists on each side. Just West of the Academy Boulevard access (prior to the intersection of Hancock and Academy), an 8' D-10-R exists. To the East of the Academy Boulevard and its access drives, a 15' D-10-R exists. Continuing East along Hancock, two more 15' D-10-Rs exist prior to Jet Wing Drive. Just to the East of the intersection of Jet Wing and Hancock, an existing channel crosses under Hancock Expressway.

PROPOSED DRAINAGE:

Basin A developed flows, $Q_5 = 14.71$ cfs/ $Q_{100} = 33.11$ cfs, are based upon the developed conditions. Stormwater from Basin A was split into three sub-basins for outlet sizing. Sub-basins A1 and A2 are proposed to outfall into the creek by way of inlets and piping at a 45° angle downstream (above the 100 year floodplain elevation), onto proposed riprap on top of the soil over the 100 year riprap lining in the creek banks. The access drive and parking areas on-site will be constructed with curb and gutter. The curb and gutter will help convey stormwater from Basin A to low points adjacent to the creek. The future shared access to Astrozon Boulevard will not be a part of this project.

Sub-basin A1 is expected to generate $Q_5 = 3.90$ cfs/ $Q_{100} = 8.48$ cfs. At the low point of the parking area of Sub-basin A1, adjacent to the creek, a 7' D-10-R is proposed to intercept the 100 year storm event. The outfall for the 7' D-10-R inlet will be through proposed 24" CMP and onto riprap. Sub-basin A2 is expected to generate $Q_5 = 6.87$ cfs/ $Q_{100} = 15.45$ cfs.

At the low point of the parking area of Sub-basin A2, adjacent to the creek, an 8' D-10-R is proposed. The outfall for the 8' D-10-R inlet will be through proposed 24" CMP and onto riprap to intercept the 5 year storm event. 100 year storm event overflow was provided for the 8' D-10-R within a proposed swale. Off-site Basin 1 and 2 stormwater was included for the Sub-basin A2 outlet. Sub-basin A3 is expected to generate $Q_5 = 6.92$ cfs/ $Q_{100} = 3.24$ cfs. Sub-basin A3 will discharge into a proposed swale along the proposed concrete fence.

The proposed swales will have 4:1 (H:V) side slopes and outfall into the creek with proposed riprap on the bank. The proposed swales were sized for conveyance of the 100 year storm event. To be conservative, the small area of Off-site Basin 1 entering Sub-basin A1 was added to the area of the Sub-basin prior to calculating runoff. To be conservative with Sub-basin A2, the entire Off-site Basin 1 was added to the runoff of the Sub-basin, even though one small area of Off-site Basin 1 is not expected to drain into the Sub-basin.

The site's access drive off of Hancock Expressway will cross over 4 proposed 7'X2.5' box culverts. A transition will be constructed from the existing concrete channel to the box culverts on both ends. The culverts were designed to pass the 100 year storm event under the access drive.

Channel improvements are being proposed in accordance with the Sand Creek DBPS. Two erosion control checks are being proposed across the width of the creek, as proposed in the DBPS. The details on the enclosed Sand Creek Improvements plan and profile sheet were duplicated from the DBPS details. The side slopes of the creek along the site are being proposed to contain 100 year storm event riprap.

In the existing channel, prior to discharge into the existing pipe, the City suggested removal of the existing asphalt to provide positive flow toward the creek in the 100 year storm. The Cross-section "For City" was provided along this alignment, as requested by the City. Along this alignment, a slope of 1/4" per foot (2%) toward the creek is proposed. The area adjacent to the alignment will also be regraded to provide positive flow toward the creek.

FLOODPLAIN STATEMENT:

This site is located on Map No. 08041CO742 F of the Federal Emergency Management Agency's Flood Insurance Rate Map (FEMA FIRM) dated March 17, 1997. A very small portion of the site in the North corner is located within the 100 year floodplain (Zone AE). Through lineal interpolation between the creek cross-sections, the Zone AE 100 year floodplain elevation would be 5881.8± in that North corner of the site. Two (2) different areas of Zone X are located on the site. Part of the site was determined to be in the Zone X outside of the 500 year floodplain. The other Zone X area is labeled in the drainage plan as Zone X floodplain. This Zone X floodplain is believed to be an area of 100 year flood with average depths of less than 1 foot, as stated in the FEMA FIRM legend. The base floor elevations for the proposed buildings will be a minimum of 1' above the 100 year floodplain elevation. See the drainage plan for the proposed first floor (FF) elevations of the buildings. The proposed retaining walls along the creek bank will be above the 100 year developed flowrate specified in the DBPS. After the proposed Sand Creek improvements, the floodplain will be confined within the channel. A Floodplain Development Permit will be acquired prior to the commencement of construction within the Sand Creek Drainage Way 100 year floodplain.

DRAINAGE IMPROVEMENTS:

The following public drainage improvements for this project will be required as a result of this development:

7'X2.5' box culvert - 4 qty. - 61 LF ea. @ \$180/LF	\$ 43,920.00
Concrete channel transition - 56 CY @ \$200/CY	\$ 11,200.00
2 qty. - Concrete erosion control check - 87 CY total @ \$200/CY	\$ 17,400.00
Riprap erosion control check, Type 'H' - 865 CY @ \$44/CY	\$ 38,060.00
Riprap 100 yr lining, Type 'L' to 'H' - 1,960 CY @ \$44/CY	\$ 86,240.00
4 qty. - Riprap for outfalls - 5 CY ea. @\$35/CY	\$ 700.00
1' wide chase - 1 qty. @ \$2,000 ea.	\$ 2,000.00
7' D-10-R - 1 qty. @ \$3,000 ea.	\$ 3,000.00
8' D-10-R - 1 qty. @ \$3,000 ea.	\$ 3,000.00
24" CMP - 98 LF @ \$30/LF	\$ 2,940.00
Sub-Total	<u>\$208,460.00</u>
15% Contingencies	<u>\$ 31,269.00</u>
TOTAL	<u>\$239,729.00</u>

FEES:

Sand Creek Drainage Fees:

7.8 acres @ \$6,915/acre \$53,937.00

Sand Creek Bridge Fees:

7.8 acres @ \$412/acre \$3,213.60

Sand Creek Pond Fees (Land):

7.8 acres @ \$448/acre \$3,494.40

Sand Creek Pond Fees (Facility):

7.8 acres @ \$1,543/acre \$12,035.40

EROSION CONTROL:

Erosion control in conformance with an approved Grading and Erosion Control Plan will be installed during the construction phase of this development. The stormwater will be safely conveyed to Sand Creek through the site and by adequate outfalls. Construction of the proposed drainage and erosion control facilities will ensure that this subdivision will not adversely affect downstream or surrounding areas.

Curb-Opening Inlet in Sump Condition Sizing

$$Q_i F = 3.0 L_i d_i^{1.5}$$

Where:

Q_i = capacity of the inlet, cfs;

F = adjustment factor for clogging, 1.25;

L_i = length of clear opening, ft (minimum);

d_i = depth of water above inlet lip, 0.67 ft for D-10-R

Sub-basin A1:

$$Q_i = Q_{100} = 8.48 \text{ cfs}$$

$$8.48 \text{ cfs} (1.25) = 3.0 L_i (0.67 \text{ ft})^{1.5}$$

$$L_i = 6.44 \text{ ft} = 7' \text{ D-10-R}$$

Sub-basin A2:

$$Q_i = Q_5 \text{ Sub-basin A2} + Q_5 \text{ Off-site Basin 1 and 2} = 6.87 \text{ cfs} + 2.27 \text{ cfs} + 1.29 \text{ cfs} = 10.43 \text{ cfs}$$

$$10.43 \text{ cfs} (1.25) = 3.0 L_i (0.67 \text{ ft})^{1.5}$$

$$L_i = 7.92 \text{ ft} = 8' \text{ D-10-R}$$

Federal Emergency Management Agency

LEGEND

SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD

ZONE A No base flood elevations determined.

ZONE AE Base flood elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

ZONE A99 To be protected from 100-year flood by Federal flood protection system under construction; no base elevations determined.

ZONE V Coastal flood with velocity hazard (wave action); no base flood elevations determined.

ZONE VE Coastal flood with velocity hazard (wave action); base flood elevations determined.

FLOODWAY AREAS IN ZONE AE

OTHER FLOOD AREAS

ZONE X Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.

OTHER AREAS

ZONE X Areas determined to be outside 500-year floodplain.

ZONE D Areas in which flood hazards are undetermined.

UNDEVELOPED COASTAL BARRIERS

Horizontal Coordinates Based on North American Datum of 1927 (NAD 27) Projection.

NOTES

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all planimetric features outside Special Flood Hazard Areas.

Coastal base flood elevations apply only landward of 0.0 NGVD, and include the effects of wave action; these elevations may also differ significantly from those developed by the National Weather Service for hurricane evacuation planning.

Areas of Special Flood Hazard (100-year flood) include Zones A, AE, AH, AO, A99, V, and VE.

IN THIS PANEL IS LOCATED WITHIN
