Revised: January 2019

Certification Statements:

This report and plan for the drainage design of The Crest at Woodmen Looart Subdivision Filing No. 6 Phases 1, 2, & 3 was prepared by me (of under my direct supervision) and is correct to the best of my knowledge and belief. Said report and plan has been prepared in accordance with the *City of Colorado Springs Drainage Criteria Manual* and is in conformity with the master plan of the drainage basin. I understand that the City of Colorado Springs does not and will not assume liability for drainage facilities designed by others. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Developer's Statement:

Crest at Woodment, LLC hereby certifies that the drainage facilities for The Crest at Woodmen Looart Subdivision Filing No. 6 - Phases 1, 2, & 3 shall be constructed according to the design presented in this report. I understand that the City of Colorado Springs does not and will not assume liability for the drainage facilities designed and/or certified by my engineer and that are submitted to the City of Colorado Springs pursuant to section 7.7.906 of the City Code; and cannot, on behalf of Crest at Woodmen, LLC, guarantee that final drainage design review will absolve Crest at Woodmen, LLC and/or their successors and/or assigns of future liability for improper design. I further understand that approval of the final plat does not imply approval of my engineer's drainage design.

I. INTRODUCTION

This document is the Master Development Drainage Plan Amendment and Preliminary Drainage Report (MDDP/PDR) for The Crest at Woodmen - Phase 1 West, Phase 2 East, Phase 3 Southeast Project, which consists of redeveloping the property for commercial/retail uses.

The purpose of this report is to identify on and offsite drainage patterns, locate and identify tributary or downstream drainage features and facilities that impact the site and to identify drainage facility preliminary sizing and locations. An MDDP has been previously prepared for this site titled *Master Development Drainage Plan for the Crest at Woodmen – Looart Subdivision Filing No. 6* by Galloway & Company approved by the City on 5/17/18 (approved MDDP). This report will refine the conceptual design for the site since there is an updated site plan for the site. This report also discusses the changes from the approved MDDP, which entails including the proposed Campus Drive roadway and the location for Pond A moved from the southeast corner of the site to the southern end of the site.

II. GENERAL LOCATION AND DESCRIPTION

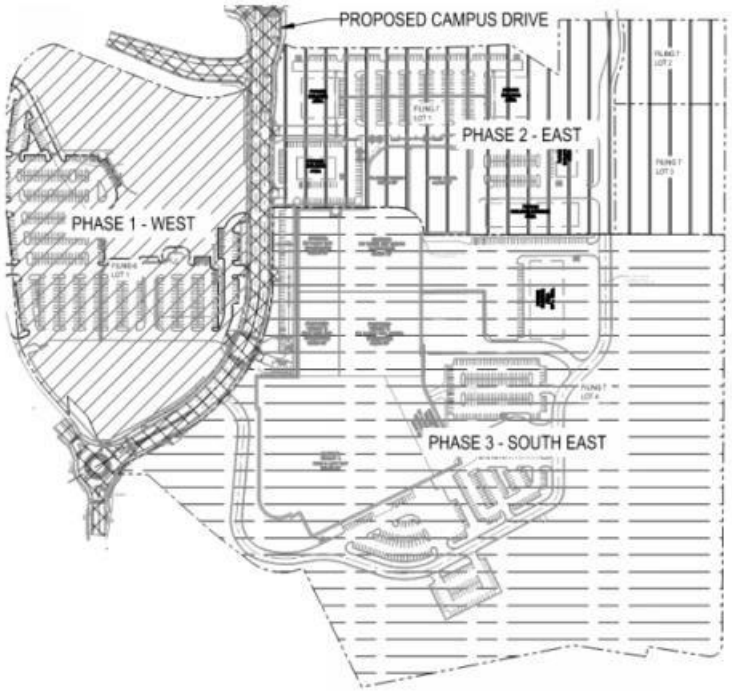
A. Location

The Crest at Woodmen project property is located in the southwest one-quarter of Sections 8, Township 13 South, Range 66 West of the 6th Principal Meridian, in the City of Colorado Springs, El Paso County, Colorado. The development site is located south of E. Woodmen Road at Campus Drive in Colorado Springs, Colorado. This site is bounded by Woodmen Road to the north, Vincent Drive to the west, Yorkshire Estates to the east and Cottonwood Creek to the south. The site itself is currently developed with office and warehouse buildings and associated drives, parking, landscape and utilities. See the Vicinity Map in Appendix A.

The site currently covers an area of approximately 76.8 acres in size (Lot 1 Block 1 Looart Subdivision Filing 5). The site will be redeveloped into 4 phases: Campus Drive; Phase 1 West, Phase 2 East, and Phase 3 Southeast. Campus Drive is a proposed public road that runs north to south through the property and consists of approximately 2.6 acres, creating Lot 1 (west of Campus Dr.) and Lot 2 (east of Campus Dr.) as referenced in the Looart Filing 6 Plat (not yet recorded). A Preliminary/Final Drainage Report has been approved by the City for Campus Drive titled *Preliminary/Final Drainage Plan and Report for Crest at Woodmen Campus Drive Looart Subdivision Filing No. 6* (Campus FDR) by Galloway & Company approved 5/15/18.

The Crest at Woodmen Phase 1 West area (Looart Filing 6 Lot 1) examines approximately 15.6 acres and is bounded to the north and west by Vincent Drive, to the east by Campus Drive. Phases 2 and 3 will split Filing 6 – Lot 2 into 4 separate lots (reference the Filing 7 plat, to be recorded after Filing 6). The Crest at Woodmen Phase 2 East area (Looart Filing 7 Lots 1,2, and 3) examines approximately 17.0 acres and is bounded by the north by Woodmen Rd, by the west by Campus Drive, and by existing residential development to the east. Phase 2 - East is intended to be rezoned “PBC,” Planned Business Center, for the construction of

commercial/retail parcels. The Crest at Woodmen Phase 3 Southeast area (Looart Filing 7 Lot 4) examines approximately 41.8 acres and is bounded by the east by existing residential development and to the south by Cottonwood Creek. Refer to the Phasing exhibit below and in Appendix A.



According to the U.S. Department of Agriculture Natural Resources Conservation Service Soil Survey of El Paso County, Colorado the primary (82.3%) soil found is Blendon sandy loam; the remaining soils are Travessilla-Rock (9.7%) and Truckton sandy loam (11.4%). Blendon sandy loam are classified as Soil Conservation Service (SCS) hydrologic soil group "B", Travessilla-Rock is classified as SCS hydrologic soil group "D" and Truckton sandy loam is classified as SCS hydrologic soil group "A". For the purpose of this report, the drainage calculations used Type "B" to estimate the proposed runoff. A copy of the soil map as well as more detailed information regarding the individual soil properties can be found in Appendix A.

The proposed site is located within Zone X, as referenced from FEMA Flood Insurance Rate Map (08041C0516F).

III. HISTORIC DRAINAGE PATTERNS AND FEATURES

The proposed project site is located within the Cottonwood Creek Drainage Basin as described in the Drainage Basin Planning Study (DBPS) prepared by URS in 1994. This study was later

modified by Ayres Associates in June of 2000. The study was modified to resolve high improvement costs associated with it and to address some unresolved issues.

For the purposes of this report historic refers to the pre-redeveloped state of the site. The pre-redeveloped state is depicted on the historic drainage map included in the appendices.

The proposed site is located in sub basin W2 of the Cottonwood Creek Basin per the DBPS. Subbasin W2 is approximately 79.7 acres in size.

The site is currently developed with multiple buildings and associated drives, parking and landscaping. There is a significant amount of trees and natural vegetation at the northwest corner of the site as well as along the west side of the site.

The topography of the site varies significantly across the property with the highest point of the site located in the northeast corner of the property. This high point, located at the northeast access (at Woodmen Road) is at an elevation of 6370. The existing drives and parking lots on site range in slopes from 2% to 7.4%. The open space areas range in slopes from 1% to 39%. The low point of the site is located at the southwest corner of the site where Vincent Drive crosses Cottonwood Creek.

In order to understand the existing hydrology, the project site was modeled in its current condition. The proposed project site comprises of portions of Basin W2 as identified in the Drainage Basin Planning Study prepared by URS. Outfall 20 corresponds to the Cottonwood Creek Tributary. For the purposes of the proposed project, Basin W2 was further subdivided as documented below, and shown on the Historic Drainage Map in Appendix E. However, in the current condition, there are 2 different outfall locations (southeast corner of Basin W2 and southwest corner of Basin W2, see Historic Drainage Map). A copy of the drainage map from the DBPS prepared by URS has been included for reference in Appendix B.

BASIN W2a is an 11.95 acre watershed which is comprised of open space and an existing water quality pond along the eastern edge of the site. This basin discharges via a grass swale at the southeast outfall of W2 (Q_5 = 2.8 cfs, Q_{100} = 29.2 cfs).

Basin OS-E is a 33.90 acre watershed (Q_5 = 151.1 cfs, Q_{100} = 210.3 cfs). This watershed covers the existing Yorkshire Estates Subdivision, portions of Woodmen Road, the existing Home Depot, REI, and other portions of the commercial development at the northwest corner of the Woodmen & Academy intersection. This basin is based upon information contained within the Woodmen Road Phase 1 improvements drainage report. This watershed outfalls into an existing water quality pond located on the subject property. Runoff in excess of the water quality volume overtops the pond and continues south through a stabilized channel to Cottonwood Creek.

BASIN W2b is a 2.56 acre watershed which is made up of portions of the existing parking lot on the north side of the site. Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 7.3 cfs, Q_{100} = 16.4 cfs).

BASIN W2c is a 1.56 acre watershed which is comprised of a portion of the existing building. Runoff generated from this basin enters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 6.8 cfs, Q_{100} = 12.2 cfs).

BASIN W2d is a 5.07 acre watershed which is made up of a portion of the existing parking lot on the east side of the site. Stormwater generated from this basin enters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 11.1 cfs, Q_{100} = 27.5 cfs).

BASIN W2e is a 4.23 acre watershed which contains a portion of the parking lot on the east side of the site. Renters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 11.4 cfs, Q_{100} = 24.4 cfs).

BASIN W2f is a 4.76 acre watershed containing a portion of the existing building. Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 20.6 cfs, Q_{100} = 37.2 cfs).

BASIN W2g is a 10.13 acre watershed which contains a portion of the existing parking lot at the southeast corner of the site. Stormwater from this basin enters the existing storm sewer system and ultimately discharges at the southeast outfall of W2 (Q_5 = 19.7 cfs, Q_{100} = 52.3 cfs).

BASIN W2h is a 3.49 acre watershed located at the north end of the site which is comprised of open space and a portion of a private roadway. Runoff generated within the basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 3.39 cfs, Q_{100} = 10.3 cfs).

BASIN W2i is a 5.28 acre watershed on the northwest side of the site which is comprised of open space and a portion of the existing parking lot. Stormwater from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 11.8 cfs, Q_{100} = 29.4 cfs).

BASIN W2j is a 0.74 acre watershed which is made up of a portion of an existing building on the west side of the site. Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 3.2 cfs, Q_{100} = 5.8 cfs).

BASIN W2k is a 0.55 acre watershed which is made up of a portion of an existing building on the west side of the site. Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 2.4 cfs, Q_{100} = 4.3 cfs).

BASIN W2l is a 6.01 acre watershed which is made up of a portion of an existing building in the center of the site. Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 26.1 cfs, Q_{100} = 47.0 cfs).

BASIN W2m is a 10.49 acre watershed in the southwest corner of the site, and is comprised of open space, private roadways, and parking lot. Runoff generated from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 9.7 cfs, Q_{100} = 42.1 cfs).

BASIN W2n is a 10.27 acre watershed along the southern edge of the site, and is comprised of open space, private roadways, and parking lot. Runoff generated from this basin sheet flows and discharges at the southwest outfall of W2 (Q_5 = 9.0 cfs, Q_{100} = 35.8 cfs).

BASIN W2o is a 4.09 acre watershed is comprised of open space along the western edge of the site. Runoff from this basin sheet flows south and is collected in the existing storm sewer system and discharges at the southwest outfall of W2 (Q_5 = 0.8 cfs, Q_{100} = 12.8 cfs).

BASIN OS3 is a 2.12 acre watershed which sheet flows and is routed to an existing storm sewer inlet and outfalls into Basin W2m before ultimately discharging at the southwest outfall of W2 (Q_5 = 2.9 cfs, Q_{100} = 9.6 cfs).

BASIN OS4 is a 0.80 acre watershed located on the northwest side of Vincent Drive (northwest corner of the site). Runoff from this basin enters the existing storm sewer system and ultimately discharges at the southwest outfall of W2 (Q_5 = 3.2 cfs, Q_{100} = 6.0 cfs).

IV. DRAINAGE DESIGN CRITERIA

The analysis and design of the stormwater management system for this project was prepared in accordance with the criteria set forth in the City of Colorado Springs Drainage Criteria Manual (DCM) Volumes 1 & 2, dated May 2014.

The rational method was used to calculate peak flows as the tributary areas are less than 100 acres. The rational method has been proven to be accurate for basins of this size and is based on the following formula:

$Q = CIA$

Where:

Q = Peak Discharge (cfs)

C = Runoff Coefficient

I = Runoff intensity (inches/hour)

A = Drainage area (acres)

The rainfall intensity calculations are based on the DCM Figure 6-5 and IDF equations. The one hour point rainfall data for the design are listed in Table 1 below.

Table 1 - Precipitation Data

Return Period	One Hour Depth (in).	Intensity (in/hr)
5-year	1.50	5.17
100-year	2.52	8.68

Time of concentrations have been adapted from the equation 6-7 of The City of Colorado Springs Drainage Criteria Manual, Volume 1 which are as follows:

$Tc=T_i + T_t$

Where:

T_c = time of concentration (min)
T_i = overland (initial) flow time (min)
T_t = travel time in the ditch, channel, gutter, storm sewer, etc. (min)

Overland (Initial) Flow Time: from equations 6-8 from the City of Colorado Springs Drainage Criteria Manual, Volume 1.

$$t_t = \frac{0.395(1.1 - C_5)\sqrt{L}}{S^{0.33}}$$

Where:

T_i = overland (initial) flow
C_5 = runoff coefficient for 5-year frequency
L = length of overland flow (300 ft maximum for non-urban land uses, 100 ft maximum for urban land uses)
S = average basin slope

Travel Time

$V = C_v * S_w 0.5$

Where:

V = Velocity (ft/s)
C_v = conveyance coefficient
S_w = watercourse slope (ft/ft)

The runoff coefficients are calculated based on land use, percent imperviousness, and design storm for each basin, as shown in the DCM, (Table 6-6). The runoff coefficient for commercial impervious basins was 0.88 (100-year) and 0.81 (5-year) per the DCM. The appendix contains runoff coefficient calculations for basins that were not 100% impervious.

The 100-year event was used as the major storm event to show where inlets are necessary based on the capacity of the street and to estimate storm drain pipe sizes based on mannings equation. Inlets will be sized at the Final Drainage Report stage.

The full spectrum detention method (FSD) was used to size both of the proposed water quality/detention ponds. This method attributes two design volumes; one being the Excess Urban Runoff Volume (EURV) and the other bring the 100-year detention volume. This approach includes the Water Quality Capture Volume (WQCV) with the EURV; therefore, no additional volume for the WQCV is required. The equations contained within the DCM were utilized to

calculate the required EURV and WQCV values. The latest UD-Detention spreadsheet from UDFCD was not utilized as it contains different C values and allowable release rates than those contained within the DCM.

As will be discussed later in the report the hydraulics of the ponds is quite complex due to the accounting of water quality for offsite basins, but not EURV or 100-year flood volume for those basins. Additionally, Pond A will overdetain to allow a larger release from Pond B. To accurately account for the complex hydraulics of the ponds EPA SWMM 5.1.010 was utilized to both create hydrographs for the tributary basins and to route runoff through the ponds. EPA SWMM was also utilized to verify that the ponds WQ/EURV volume will drain in 72 hours while the straight WQCV for the pond does not drain faster than 40 hours. The UDFCD spreadsheet UD-Detention 2.34 was utilized to calculate the stage discharge curves for the ponds.

V. PROPOSED DRAINAGE PLAN

A. General Description

Historically, there are two outfall locations from the site; at the southeast corner of the site and the southwest corner of the site. The southwest outfall location will remain and an outfall will be provided at the southern portion of the site. There are two proposed detention ponds on the site. The purpose of the ponds is to provide water quality and detain developed runoff to at or below historic rates. The ponds will be discussed in more depth later in the report.

A future roadway has been designed to bisect the property, Campus Drive. A Preliminary/Final Drainage Report has been approved by the City for Campus Drive titled *Preliminary/Final Drainage Plan and Report for Crest at Woodmen Campus Drive Looart Subdivision Filing No. 6* (Campus FDR) by Galloway & Company approved 5/15/18. The detention pond shown in the Campus FDR for Campus Drive will be modified and enlarged and is now referenced as “Pond B” (see section V-D and the Proposed Drainage Map in Appendix D).

B. Four Step Process

The Four Step Process to minimize the adverse impacts of urbanization is vital component of developing a balanced, sustainable project. Below identifies the approach to the four step process:

1. Employ Runoff Reduction Practices

This step uses low impact development (LID) practices to reduce runoff at the source. Generally rather than creating point discharged that are directly connected to impervious areas runoff is routed through pervious areas to promote infiltration. Due to the existing site constraints and topography this is a difficult task. Grass buffers and swales are encouraged and used where practical. Runoff reduction plays a large role in the overall system design as detention volume and water quality control volume is minimized.

2. Implement BMPs That Provide a Water Quality Capture Volume with Slow Release

This step utilizes formalized water quality capture volume to slow the release of runoff from the site. Both proposed ponds (Pond A & Pond B) will provide EURV volume for

the new development which incorporates a 72 hour release. These ponds will also provide WQCV for the offsite tributary areas which will release in no less than 40 hours.

3. Stabilize Drainageways

This step implements stabilization to channels to accommodate developed flows while protecting infrastructure and controlling sediment loading from erosion in the drainageways. Improvements to Cottonwood Creek have recently been made. These improvements have already taken into account developed flows from the site (as the site was currently developed). With this project, these rates will be reduced back to pre-redevelopment values. Therefore, the recently completed channel improvements will be adequate for this development as they take into account the existing undetained site conditions.

4. Implement Site Specific and Other Source Control BMPs

This step is typically implemented at a detailed level when the site develops. Source control BMPs protect the release of pollutants from outdoor storage areas. Trash enclosures will be provided for the lots as they develop which will reduce trash from leaving the lots. This will be identified and implemented within future Final Drainage reports for the site.

C. Proposed Basins

The original DBPS prepared by URS identified one Basin for our project site, W2, as described previously. For the proposed drainage design, new basin designations were required as a result of the proposed improvements. The basin size and locations shown in the FDR for Campus Drive will stay the same.

The basins and their proposed size, shape and orientation can be seen on the proposed drainage map found in Appendix C.

Basin A1 (2.47 AC, Q_5 = 10.2 cfs, Q_{100} = 18.6 cfs): a basin defining the area of future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 50. Flow will be routed to proposed Pond A.

Basin A2 (2.48 AC, Q_5 = 3.4 cfs, Q_{100} = 8.4 cfs): a basin defining the area of future private roadway and future commercial for the Phase 2 development. A proposed storm sewer system will collect runoff from this basin and tie into the proposed inlet at DP 54A. Flow will be routed to proposed Pond A. Any bypassed flow will enter Basin A7 and will enter the storm system at the inlet at DP 60A.

Basin A3 (3.81 AC, Q_5 = 10.1 cfs, Q_{100} = 19.8 cfs): a basin defining the area of future commercial for the Phase 2 development. Flow will enter the system at the proposed inlet at DP 58 and will be routed to proposed Pond A.

Basin A4 (3.44 AC, Q_5 = 14.6 cfs, Q_{100} = 26.6 cfs): a basin defining the area of building rooftop and future commercial lot for the Phase 2 development. The proposed storm sewer storm sewer system will collect runoff from this basin and tie into the proposed inlet at DP 59A. Flow will be

routed to proposed Pond A.

Basin A5 (0.33 AC, Q_5 = 1.6 cfs, Q_{100} = 2.8 cfs): a basin defining the area of a future private roadway. The storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 54B. Flow will be routed to proposed Pond A.

Basin A6 (3.33 AC, Q_5 =14.0 cfs, Q_{100} = 25.4 cfs): a basin defining the area of a future commercial lot. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm system at DP 51A. Flow will be routed to proposed Pond A.

Basin A7 (2.86 AC, Q_5 = 11.7 cfs, Q_{100} = 21.4 cfs): a basin comprised of building rooftop and future commercial area for the Phase 3 development. An existing trench drain will remain in place and collect some of the runoff, with the rest entering the system at the inlet located at DP 60A.The proposed storm system will replace the existing storm sewer system and will collect runoff which will then be routed to Pond A.

Basin A8 (0.60 AC, Q_5 = 2.8 cfs, Q_{100} = 5.0 cfs): a basin comprised of future commercial for the Phase 3 development. A proposed inlet will collect runoff at DP 61A and tie into the proposed storm sewer system that is replacing the existing system. Flow will be routed to proposed Pond A.

Basin A9 (1.33 AC, Q_5 = 5.9 cfs, Q_{100} = 10.6 cfs): a basin comprised of a future commercial area for the Phase 3 development. With future development, a storm sewer system will collect runoff from this basin and tie into a future storm inlet at DP 55A. Flow will be routed to proposed Pond A.

Basin A10 (2.75 AC, Q_5 = 11.4 cfs, Q_{100} = 20.7 cfs): a basin comprised of building rooftop and future commercial area for the Phase 3 development. An existing trench drain will remain in place and collect some of the runoff, with the rest entering the system at the inlet located at DP 62A.The proposed storm system will replace the existing storm sewer system and will collect runoff which will then be routed to Pond A.

Basin A11 (3.80 AC, Q_5 = 15.7 cfs, Q_{100} = 29.0 cfs): a basin comprised of building rooftop and future commercial area for the Phase 3 development. Runoff will flow through the parking lot and enter the storm sewer system at the inlet at DP 56A. Flow will be routed to proposed Pond A.

Basin A12 (0.24 AC, Q_5 = 1.0 cfs, Q_{100} = 1.8 cfs): a basin defining the area of future private roadway. The storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 56B. Flow will be routed to proposed Pond A.

Basin A13 (5.00 AC, Q_5 =17.3 cfs, Q_{100} = 31.5 cfs): a basin defining the area of a future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 58C. Flow will be routed to proposed Pond A.

Basin A14 (0.05 AC, Q_5 = 0.2 cfs, Q_{100} = 0.4 cfs): a basin defining a small area of future commercial for the Phase 3 development. The inlets will tie into the storm sewer system at DP 63

and will be routed to Pond A.

Basin A15 (1.09 AC, Q_5 = 5.1 cfs, Q_{100} = 9.1 cfs): a basin defining future commercial area for the Phase 3 development. Runoff will be collected at DP 65A with an inlet and tied into the storm sewer system. Flow will be routed to proposed Pond A.

Basin A16 (1.21 AC, Q_5 = 5.6 cfs, Q_{100} = 10.1 cfs): a basin defining the private roadway along the south side of the Phase 3 development. The storm sewer system will collect runoff from this basin at DP 57A. Flow will be routed to proposed Pond A.

Basin A17 (5.24 AC, Q_5 = 19.8 cfs, Q_{100} = 36.1 cfs): a basin defining the area of future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 66A. Flow will be routed to proposed Pond A.

Basin A18 (4.12 AC, Q_5 = 16.9 cfs, Q_{100} = 30.9 cfs): a basin defining the area of future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 66B. Flow will be routed to proposed Pond A.

Basin A19 (0.69 AC, Q_5 = 3.2 cfs, Q_{100} = 5.7 cfs): a basin defining a future commercial area for the Phase 3 development. An inlet will collect runoff at DP 68A and into the storm sewer system to route the flow to Pond A.

Basin A20 (1.06 AC, Q_5 = 4.9 cfs, Q_{100} = 8.9 cfs): a basin defining future commercial area. An inlet will collect runoff at DP 67A and into the storm sewer system to route the flow to Pond A.

Basin A21 (0.45 AC, Q_5 = 2.1 cfs, Q_{100} = 3.7 cfs): a basin defining future commercial area. An inlet will collect runoff at DP 69A and into the storm sewer system to route the flow to Pond A.

Basin A22 (3.45 AC, Q_5 = 1.8 cfs, Q_{100} = 10.6 cfs): a basin defining the area of Pond A. Pond A is the confluence point for all 'A' basins. Released flow from Pond A will outfall into Cottonwood Creek.

Basin OSE is a 33.90 acre watershed (Q_5 = 151.1 cfs, Q_{100} = 259.4 cfs). This watershed covers the existing Yorkshire Estates Subdivision, portions of Woodmen Road, the existing Home Depot, REI, and other portions of the commercial development at the northwest corner of the Woodmen & Academy intersection. This basin is based upon information contained within the Woodmen Road Phase 1 improvements drainage report. The existing pipe will be extended through the proposed site to the proposed Pond A. An excerpt from the Woodmen Road Phase 1 improvements Drainage Report can be found in Appendix B.

Basin B1-1 (1.32 AC, Q_5 = 1.0 cfs, Q_{100} = 5.0 cfs): a basin consisting of steep terrain with shallow bedrock, has abundant vegetation and will remain undeveloped. Storm runoff will sheet flow to a proposed inlet west of Campus Drive at DP 1. This inlet is the start of the storm sewer system and will collect the flows and convey them to proposed Pond B.

Basin B1-2 (0.38 AC, Q_5 = 1.2 cfs, Q_{100} = 2.1 cfs): a basin comprised of building rooftop for the Phase 1 development. Flow will enter a roof drain which will tie into the proposed system at DP 1. Flow will be routed to Pond B.

Basin B2 (1.15 AC, Q_5 = 2.4 cfs, Q_{100} = 5.3 cfs): a basin consisting of Campus Drive half-street and walk areas. Runoff sheets flows from the street and walk areas and is conveyed in the proposed curb & gutter to the inlet at DP 7 and conveys the flow within the Campus Drive storm sewer system to proposed Pond B.

Basin B3-1 (7.34 AC, Q_5 = 17.7 cfs, Q_{100} = 34.7 cfs): a basin defining the area of future commercial for the Phase 1 development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 16. The storm sewer system will tie into the Campus Drive storm sewer system and flows will be routed to proposed Pond B.

Basin B3-2 (1.31 AC, Q_5 =4.8 cfs, Q_{100} = 8.9 cfs): a basin defining the area of future commercial for the Phase 1 development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 8A The storm sewer system will tie into the Campus Drive storm sewer system and flows will be routed to proposed Pond B.

Basin B3-3 (0.64 AC, Q_5 = 2.2 cfs, Q_{100} = 4.2 cfs): a basin defining the area of future commercial for the Phase 1 development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 8B The storm sewer system will tie into the Campus Drive storm sewer system and flows will be routed to proposed Pond B.

Basin B3-4 (0.92 AC, Q_5 = 2.8 cfs, Q_{100} = 5.2 cfs): a basin comprised of building rooftop for the Phase 1 development. Flow will enter a roof drain which will tie into the proposed system at DP 8A. Flow will be routed to Pond B.

Basin B4-1 (1.69 AC, Q_5 = 6.9 cfs, Q_{100} = 12.6 cfs): a basin defining the area of future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 13. The storm sewer system will tie into the Campus Drive storm sewer system and flows will be routed to proposed Pond B.

Basin B4-2 (0.87 AC, Q_5 = 3.6 cfs, Q_{100} = 6.7 cfs): a basin defining the area of future commercial development. With future development, a storm sewer system will collect runoff from this basin and tie into the proposed storm inlet at DP 18. The storm sewer system will tie into the Campus Drive storm sewer system and flows will be routed to proposed Pond B.

Basin B5-1 (0.51 AC, Q_5 = 1.8 cfs, Q_{100} = 3.3 cfs): a basin consisting of Campus Drive half-street and walk areas. Runoff sheet flows from the street and walk areas and is conveyed in the proposed curb & gutter to the inlet at DP 11 and conveys the flow within the Campus Drive storm sewer system to proposed Pond B.

Basin B5-2 (0.55 AC, Q_5 = 1.9 cfs, Q_{100} = 3.6 cfs): a basin containing a portion of Campus Drive half-street, the roundabout and existing Vincent Drive half-street. Runoff from this basin will be collected in an existing storm inlet at DP 24 and will be routed to Cottonwood Creek in an existing storm sewer system. This basin flows to existing inlets within Vincent Dr. which discharges into Cottonwood Creek.

Basin B5-3 (0.16 AC, Q_5 = 0.6 cfs, Q_{100} = 1.1 cfs): a basin containing a portion of Campus Drive half-street, the roundabout and existing Vincent Drive half-street. Runoff from this basin will be collected at DP 25 and continue to flow southeasterly towards an existing inlet in Vincent Drive which will be routed to Cottonwood Creek in an existing storm sewer system. This basin flows to existing inlets within Vincent Dr. which discharges into Cottonwood Creek.

Basin B6 (3.03 AC, Q_5 = 11.4 cfs, Q_{100} = 21.3 cfs): a basin comprised of building rooftop for the Phase 3 development. Runoff will flow into Basin 7-1 and will enter the storm sewer system to be routed to Pond B.

Basin B7-1 (0.55 AC, Q_5 = 0.3 cfs, Q_{100} = 1.5 cfs): a basin comprised of commercial area for the Phase 3 development. Flow will enter the storm system at DP 27A and will be routed to Pond B.

Basin B7 (2.51 AC, Q_5 = 3.3 cfs, Q_{100} = 9.4 cfs): a basin comprised of a private drive that connects to Campus Drive. Flow will enter the storm system at DP 27 and will be routed to Pond B.

Basin B8 (0.90 AC, Q_5 = 2.5 cfs, Q_{100} = 5.0 cfs): a basin consisting of Campus Drive half-street and walk areas as well as a portion of a new local street and adjacent landscaping. Runoff sheet flows from the street and walk areas and is conveyed in the proposed curb & gutter to the inlet at DP 12 and conveys the flow within the Campus Drive storm sewer system to proposed Pond B

Basin B9-1 (0.72 AC, Q_5 = 2.7 cfs, Q_{100} = 5.0 cfs): a basin comprised of building rooftop for the Phase 3 development. Flow will enter a roof drain at DP 9A which will be routed to the Campus Drive storm sewer system to proposed Pond B.

Basin B9 (0.96 AC, Q_5 = 1.6 cfs, Q_{100} = 3.4 cfs): a basin comprised of future commercial area for the Phase 3 development. Runoff will enter the system at DP 9 which will tie into the Campus Drive storm system. Flow will be routed to Pond B.

Basin B10 (1.05 AC, Q_5 = 3.7 cfs, Q_{100} = 7.1 cfs): a basin consisting of Campus Drive half-street and walk areas. Runoff sheet flows from the street and walk areas and is conveyed in the proposed curb & gutter to the inlet at DP 4 and conveys the flow within the Campus Drive storm sewer system to proposed Pond B.

Basin B11-1 (2.00 AC, Q_5 = 0.8 cfs, Q_{100} = 5.4 cfs): a basin defining an open space area. Flow will enter the system at DP 2A and will be routed to proposed Pond B.

Basin B11 (1.65 AC, Q_5 = 4.3 cfs, Q_{100} = 8.7 cfs): a basin comprised of a future building rooftop and future commercial area for the Phase 2 development. Runoff will enter the system at DP 2B which will tie into the storm sewer system. Flow will be routed to Pond B through the Campus Drive storm system.

Basin B12-1 (0.69 AC, Q_5 = 2.6 cfs, Q_{100} = 4.9 cfs): a basin comprised of building rooftop for the Phase 3 development. Flow will enter a roof drain which will tie into the proposed system at DP 2. Flow will be routed to Pond B through the Campus Drive storm system.

Basin B12 (0.77 AC, Q_5 = 2.8 cfs, Q_{100} = 5.4 cfs): a basin comprised of a future building rooftop and future commercial area for the Phase 2 development. Runoff will enter the system at DP 2C

which will tie into the storm sewer system. Flow will be routed to Pond B through the Campus Drive storm system.

Basin OS1 (1.29 AC, Q_5 = 5.2 cfs, Q_{100} = 9.6 cfs): a basin comprised of proposed roadway and open space area. Runoff from this basin will be collected in a storm inlet at DP 21 and will be routed to the existing storm sewer system within Woodmen Road.

Basin OS2 (0.54 AC, Q_5 = 0.9 cfs, Q_{100} = 2.6 cfs): a basin comprised of reconstructed Vincent Drive southern half-street and adjacent area. Runoff from this basin will be collected in a storm inlet at DP 22 and will be routed to a new storm sewer system which ties into the existing storm sewer system as part of the Campus Drive Roadway improvements. The existing storm sewer system ties into an existing storm sewer system within Woodmen Road.

BASIN OS3 (0.76 AC, Q_5 = 1.7 cfs, Q_{100} = 3.9 cfs): a basin comprised of reconstructed Vincent Drive northern half-street and adjacent area. Runoff from this basin will be collected in a storm inlet at DP 23 and will be routed to a new storm sewer system which ties into the existing storm sewer system as part of the Campus Drive Roadway improvements. The existing storm sewer system ties into an existing storm sewer system within Woodmen Road.

BASIN OS4 (2.05 AC, Q_5 = 2.9 cfs, Q_{100} = 8.9 cfs): a basin consisting of a portion of existing Vincent Drive and steep terrain with shallow bedrock, has abundant vegetation and will remain undeveloped. Storm runoff will sheet flow to Vincent Drive to an existing inlet at DP 14. This inlet ties into an 60" existing storm sewer system which will tie into a new storm sewer system on the Phase 1 property. A portion of the existing 60" storm sewer system will be abandoned once the proposed storm sewer system is constructed along the west side of the Phase 1 property and conveys flows to proposed Pond B.

BASIN OS5 (0.80 AC, Q_5 = 3.3 cfs, Q_{100} = 6.1 cfs): an offsite basin from the Nissan Dealership property to the west consisting of parking lot and landscaping (Refer to the excerpts of the *Final Drainage Report and Plan for I-2 Nissan* dated February 2003 in Appendix B). This area flows into an inlet on the Nissan Dealership which ties into an existing 60" storm sewer which runs across Vincent Drive and into the Crest at Woodmen property. The flows will combine with basin OS4 flows at at inlet along Vincent Drive at DP 14. This inlet ties into an 60" existing storm sewer system which will tie into a new storm sewer system on the Phase 1 property. A portion of the existing 60" storm sewer system will be abandoned once the proposed storm sewer system is constructed along the west side of the Phase 1 property and conveys flows to proposed Pond B.

D. Detention and Water Quality

There are two ponds on the proposed site: Pond A, located at the southeast corner of the site and Pond B, located at the southwest corner of the site. The proposed basins delineated with the letter A are tributary to Pond A while the basins delineated with the letter B are tributary to Pond B. Pond A will be sized to overdetain and allow Pond B to release at a higher than existing flow rates. The total release from the site will be at or below existing values.

Per section 6.4.2 of the DCM the redevelopment of sites larger than 1 acre may require on-site detention to be provided if the downstream drainage system is shown to be inadequate to convey storm runoff for the entire site. The DBPS takes into account that the site is in a developed condition and has sized the downstream infrastructure as such. With the redevelopment of the site EURV will be provided for the full redeveloped site. This will reduce the higher probability storm runoff from the site which will improve the conditions on the downstream infrastructure and will fulfill the requirement of providing water quality for all redevelopment disturbing 1 acre or more. Historically basins OS3, OS4, and OSE drain through the site undetained. This developed flow rate has been accounted for in the allowable release from the site. The proposed detention ponds are sized such that the redeveloped release from the site will be at or below the existing rate. SWMM models for both the existing and proposed conditions have been prepared to show that this accomplished utilizing the proposed ponds.

In the existing conditions Basin OSE outfalls into the site through an existing 48" storm sewer. The pipe outfalls into an existing water quality pond. The pond at best has been sized for small portions of Woodmen Road as part of the widening project from 2009. This pond does not provide water quality for the entire tributary basin. The proposed Pond A has been sized to provide water quality for the entire Basin OS-E. This is a major improvement from the existing conditions.

In the existing conditions Basins OS-3 and OS-4 flow through the site without water quality being provided for them. The proposed Pond B has been sized to provide water quality for both basins. This is a major improvement from the existing conditions.

Pond A

This pond has approximately 49.80 acres of on-site basins tributary to it (Basins A1-A22). The pond is private and will provide full spectrum, EURV, detention for the proposed development. This volume was added to the required WQCV for the offsite basin to obtain a total first stage volume of 5.74 ac-ft. This first stage was designed to drain in 72 hours. A check was done utilizing SWMM to ensure that the total WQCV in Pond A does not drain in less than 40 hours. A check was also done to ensure that the pond releases within 72 hours. The latest Urban Drainage UD-Detention spreadsheets were not utilized in these calculations due to the fact that Pond A overdetains and Pond B underdetains. All EURV and WQCV volume calculations were completed using the equations provided in the DCM. The sizing of the EURV holes was done on a preliminary level using the UD-Detention spreadsheet (with some tweaking to obtain the correct volumes), but was then checked and finalized using EPA SWMM. The orifice sizing was completed in SWMM using a pond node that was given an initial volume equal to either the EURV + WQCV for the offsite basin or the total WQCV for the total tributary area and in both cases no inflow (it assumes the storm has completed). It was then allowed to be routed through the orifices and the depth of the pond was checked at either 40 (WQCV) or 72 (EURV) hours depending on the scenario to verify the holes are correctly sized. Assumptions made in the SWMM model are as follows:

- Kinematic Wave Method
- Horton's Infiltration Method
- Manning's n for impervious areas – 0.011

- Manning's n for pervious areas – 0.024
- Depression storage for impervious areas – 0.1"
- Depression storage for pervious areas – 0.35"

These results are all contained within Appendix C.

As was mentioned previously Pond A will overdetain to allow Pond B to discharge at a higher rate. The SWMM model prepared generalizes the basins identified on the Proposed Drainage Map into single basins for onsite and offsite, for Pond A the basins are Basin A and OS-East. A predevelopment model was also prepared for the basin to identify what the release from the site would have been prior to any development on site. Both offsite basins were maintained as developed in this model since detention is not provided for them. They will be allowed to directly pass through the ponds. Discussion on total volume and release will be provided after Pond B.

Pond B

This pond has approximately 31.7 acres of on-site basins tributary to it (Basins B1-B12). The pond is private and will provide full spectrum, EURV, detention for the proposed development. In addition, the small offsite basins OS-4 and OS-5 are tributary to this pond. The orifices for the first stage were sized in the same manner that was discussed with Pond A.

As was previously mentioned Pond B will release at a rate higher than historic in an effort to shrink its footprint and create a useable area in this portion of the site. To compensate for that Pond A will overdetain. No detention has been planned for the offsite runoff coming through the site. It will be allowed to pass through the pond.

Detention Sizing

To ensure that detention is being adequately provided for the site a predevelopment SWMM model was prepared for the entire 81.4 acres of onsite basins. The offsite basins were left as a developed condition as no detention will be provided for them. The historic model was run for both the 5-year and the 100-year events. There are two historic outfalls from the site, the east and the west. The east outfall has historic rates of 141.83 cfs and 279.90 cfs in the minor and major storms respectively. The west outfall has historic rates of 10.40 cfs and 27.14 cfs in the minor and major storms respectively. The total release from both outfalls in the historic condition is 152.23 cfs and 307.04 cfs in the minor and major storms respectively.

Pond A was sized to have a release of 107.8 cfs and 219.8 cfs in the minor and major events respectively. Pond B was sized to have a release of 8.9 cfs and 79.8 cfs in the minor and major events respectively. This gives a total release of 109.0 cfs in the minor storm, which is less than the historic rate and 299.7 cfs in the major storm which is also less than the historic rate. These flow rates are derived from the Historic SWMM model for the area prior to the existing development. This includes Basin A, Basin B, and the offsite tributary area. The required volumes for the ponds are 7.36 ac-ft in Pond A and 3.10 ac-ft in Pond B. The ponds will have the required freeboard per the DCM. At the time of final design, any variances will be requested with the final drainage report.

It should be noted that in its current condition there is no detention provided for the site and that runoff release from the site will significantly exceed the historic rates designed to. The improvements provided with this development will reduce direct runoff into Cottonwood Creek and will not have negative effects on the channel system.

VI. DRAINAGE AND BRIDGE FEES

The project is located within the Cottonwood Creek Drainage Basin. This site was previously platted; therefore no drainage and bridge fees are due at this time.

VII. CONCLUSIONS

This report for The Crest at Woodmen has been prepared using the criteria and methods as described in the City of Colorado Springs Drainage Criteria Manual Volumes 1 & 2. The proposed ponds will adequately provide water quality for all tributary areas. They will also provide full spectrum detention for the onsite areas and ensure that the 100-year discharge from the site does not exceed the pre developed conditions in accordance with the DCM. The downstream facilities within Cottonwood Creek are adequate to protect the runoff proposed from the site. The site runoff will not adversely affect the downstream and surrounding developments.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado
Survey Area Data: Version 13, Sep 22, 2015

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 3, 2014—Jun 17, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — El Paso County Area, Colorado (CO625)				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
10	Blendon sandy loam, 0 to 3 percent slopes	B	70.5	78.9%
94	Travessilla-Rock outcrop complex, 8 to 90 percent slopes	D	8.6	9.7%
97	Truckton sandy loam, 3 to 9 percent slopes	A	10.2	11.4%
Totals for Area of Interest			**89.4**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 13. The **horizontal datum** was NAD83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the **North American Vertical Datum of 1988 (NAVD88)**. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, MD 20910-3282

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242 or visit its website at http://www.ngs.noaa.gov/.

Base Map information shown on this FIRM was provided in digital format by El Paso County, Colorado Springs Utilities, City of Fountain, Bureau of Land Management, National Oceanic and Atmospheric Administration, United States Geological Survey, and Anderson Consulting Engineers, Inc. These data are current as of 2006.

This map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map. The profile baselines depicted on this map represent the hydraulic modeling baselines that match the flood profiles and Floodway Data Tables if applicable, in the FIS report. As a result, the profile baselines may deviate significantly from the new base map channel representation and may appear outside of the floodplain.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact **FEMA Map Service Center** (MSC) via the FEMA Map Information eXchange (FMIX) 1-877-336-2627 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. The MSC may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

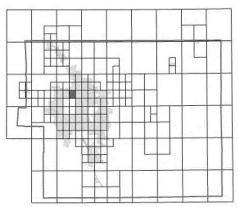
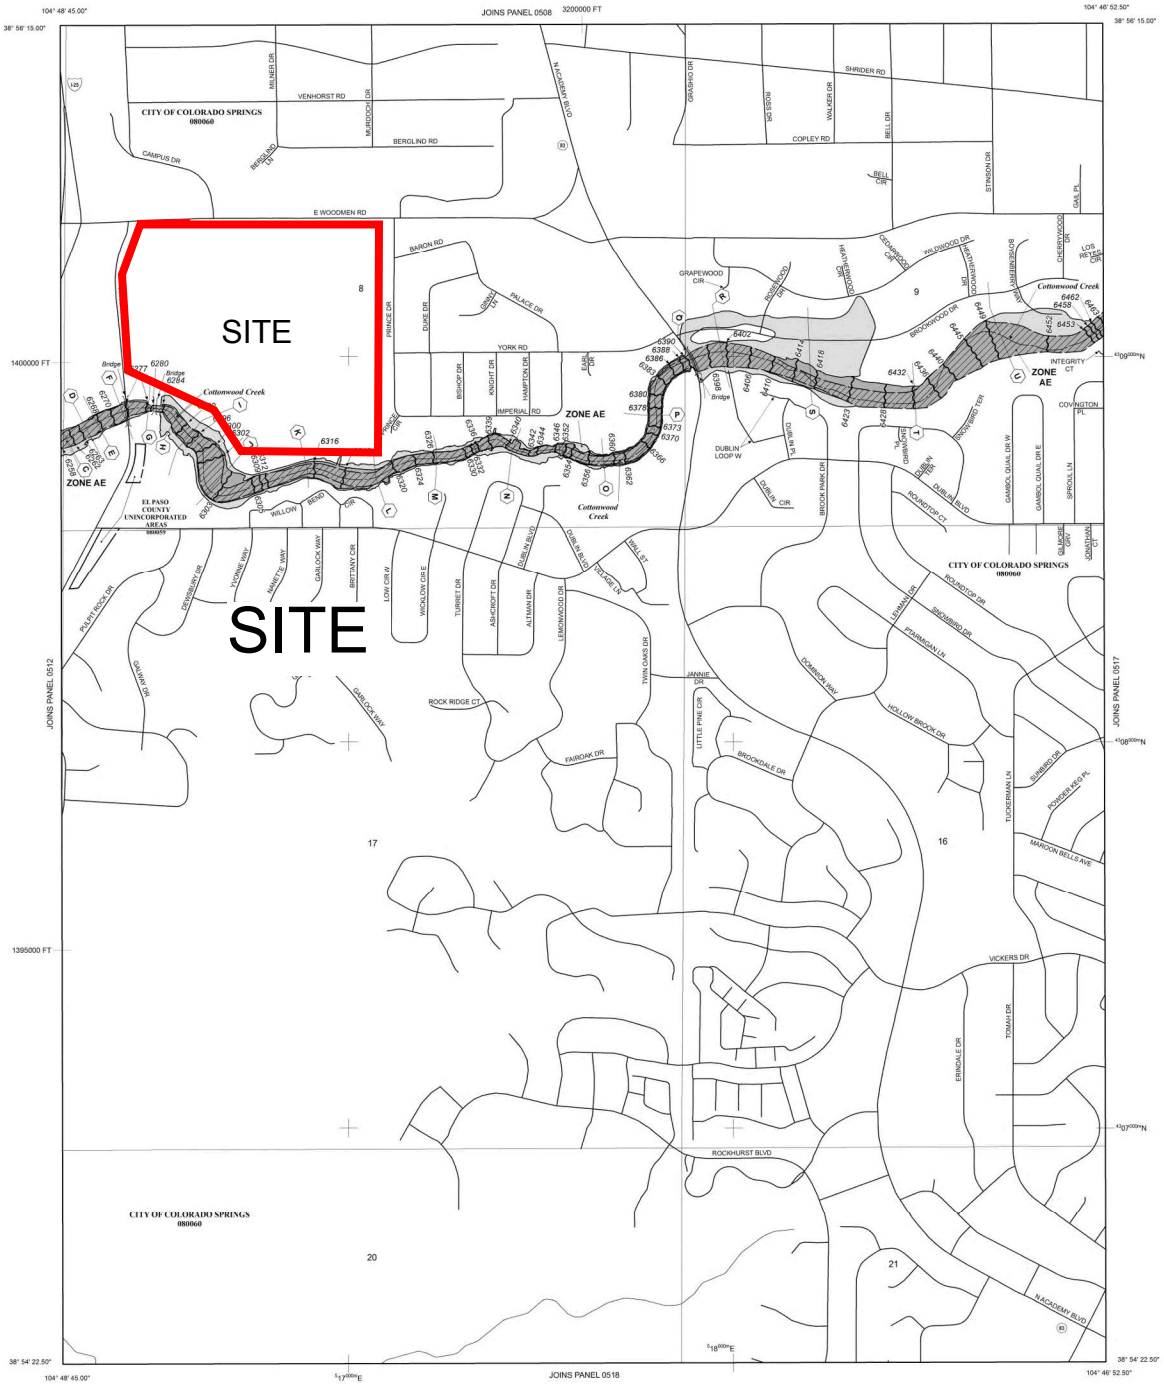
Panel Location Map



This Digital Flood Insurance Rate Map (DFIRM) was produced through a Cooperating Technical Partner (CTP) agreement between the State of Colorado Water Conservation Board (CWCB) and the Federal Emergency Management Agency (FEMA).

Additional Flood Hazard information and resources are available from local communities and the Colorado Water Conservation Board.



NOTE: MAP AREA SHOWN ON THIS PANEL IS LOCATED WITHIN TOWNSHIP 13 SOUTH, RANGE 66 WEST.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAS) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.
ZONE AE Base Flood Elevations determined.
ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR Special Flood Hazard Area Formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachments so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

Floodplain boundary
Floodway boundary
Zone D Boundary
CBRS and OPA boundary
Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

EFFECTIVE DATE OF COUNTYWIDE FLOOD INSURANCE RATE MAP
MARCH 17, 1997

EFFECTIVE DATE(S) OF REVISION(S) TO THIS PANEL
AUGUST 23, 1999
DECEMBER 7, 2018 - to update corporate limits, to change Base Flood Elevations and Special Flood Hazard Areas, to update map format, to add roads and road names, and to incorporate previously issued Letters of Map Revision.

For community map revision history prior to countywide mapping, refer to the Community Map History Table located in the Flood Insurance Study report for this jurisdiction.

To determine if flood insurance is available in this community, contact your insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

FINAL
DRAINAGE REPORT AND PLAN
FOR
I-25 NISSAN PRE-OWNED CAR DEALERSHIP
AMERICAN FURNITURE AT WOODMAN RD. FIL. NO. 1

February, 2003

Leigh & Whitehead Associates, Inc.
CONSULTING CIVIL ENGINEERS & SURVEYORS
2720 EAST YAMPA STREET, SUITE 1
COLORADO SPRINGS, CO 80909-5061

LWA Project No. 03009.64

parking for prospective car purchasers along with a display area of pre-owned and some new vehicles. Basic improvements to the I-25 off-ramp and Woodmen Road along the north are currently in the process of being constructed by the Colorado Department of Highways. Anticipated completion is unknown at this time. Vincent Drive on the east, is an existing City of Colorado Springs street, and is currently fully developed. Runoff from the Woodmen Road and I-25 off-ramp will not enter this subdivision. This development will not impact the I-25 Woodmen Road improvements.

This building's roof drains will be routed underground through 8" under drain pipes that will outlet in the appropriate parking and drive area. The location of the underground pipes and release locations are shown on the attached Drainage Plan.

Basin Characteristics:

This site was divided into two major basins delineated on the attached Drainage Plan as Basin A and Basin B. Basin A is the easterly half of this site, and was divided into two sub-basins. Sub-basin OS-A-1 located east of this property between Woodmen Road and Vincent Drive is a small, landscaped grass area that directs runoff westerly to this property. Sub-Basin OS A-1 contains 0.13 acres and generates a peak flow of 0.1 cfs for the 5-year event and 0.4 cfs for the 100-year event. These flows are directed to this site via sheetflow to a proposed 5' D10R inlet in a sump condition. The location of this inlet is shown on the attached proposed drainage plan. Sub-Basin A-2 is the easterly half of this property and directs runoff easterly and northerly to the previously mentioned 5' D10R, located in a sump condition along the easterly edge of the parking area. Sub-Basin A-2 contains 0.67 acres and generates a peak flow of 3.1 cfs for the 5-year event and 5.7 cfs for the 100-year event. Basin A has a total area of 0.80 acres and generates a peak flow of 3.3 cfs for the 5-year event, and 6.1 cfs for the 100-year event. Runoff from this inlet is conveyed easterly to the existing 60" RCP via a proposed 18" RCP at a minimum of 1% slope. The end of the existing 60" RCP will have a Type I manhole constructed. This manhole will be 5½' wide by 7½' long. These flows will then be conveyed southeasterly under Vincent Road to an appropriate outlet point, and then to Cottonwood Creek,

located south of this property.

Basin B is the westerly half of this site and contains 0.75 acres. Peak runoff exiting Basin B is 3.5 cfs for the 5-year event and 6.4 cfs for the 100-year event. Runoff is directed westerly and southerly to a curb opening located at the southwest corner of the parking lot. Runoff will be conveyed southwesterly through a 9' wide curb opening to a proposed 9' wide x 1 ½' deep rock rip-rap "V" swale to the previously mentioned undefined existing swale within the I-25 off-ramp right- of- way, and west of the Loaf and Jug. Flows will then be conveyed southerly within this swale to an existing 24" RCP located in the southwesterly portion of Lot 4. Currently, this existing swale is undefined and initial observations indicate that runoff ponds south of this site. Proposed conditions for this swale would be to construct an asphalt swale 15' wide with a 2' wide concrete pan that will be routed southerly to an existing 24" RCP located on the north edge of the American Storage Subdivision. This asphalt swale will be located adjacent to the existing I-25 exit ramp retaining wall. This paved swale will be 15' wide with 12:1 side slopes and a 2' wide concrete pan located in the center of the swale. The swale will be 0.63' deep and peak flow exiting the Nissan site is 6.4 cfs for the 100-year event. This results in a water surface depth of 0.37'. This asphalt swale will be directed southerly to lots 3 and 4 of the American Furniture Subdivision. The exact details of this swale will be shown on the construction documents and drainage plan for the I-25 Nissan New Car Dealership, Lots 3 and 4, American Furniture at Woodmen Road, Filing No. 1. The proposed/existing grass swale along the west side of the Loaf and Jug is part of the requirements as outlined in the preliminary/final drainage report for Loaf and Jug prepared by ADP Inc., and accepted by the City of Colorado Springs in January, 2001. Currently, this swale is not functioning as designed. This could be related to the continued construction of the I-25 exit ramp. A portion of the proposed swale and its location is shown on the attached Proposed Drainage Plan for I-25 Nissan. If the I-25 Nissan New Car Dealership located on Lots 3 and 4 of this subdivision is not developed in a timely manner, and it appears that the runoff from the Pre-Owned Dealership is creating problems adjacent to the I-25 exit ramp, the improvements outlined in this report will be constructed in a timely manner to prevent possible erosion and undercutting of the existing I-25 exit ramp retaining wall. These

NOTES:

$T_i = (0.395*(1.1 - C_5)*(L)^0.5)/((S)^0.33)$, S in ft/ft

T_t=L/60V (Velocity From Fig. 501)

Velocity V=Cv*S^0.5, S in ft/ft

Tc Check = 10+L/180

For Urbanized basins a minimum T_c of 5.0 minutes is required.

For non-urbanized basins a minimum T_c of 10.0 minutes is required

NOTES:

$T_i = (0.395*(1.1 - C_5)*(L)^{0.5})/((S)^{0.33})$, S in ft/ft

T_t=L/60V (Velocity From Fig. 501)

Velocity V=Cv*S^0.5, S in ft/ft

Tc Check = 10+L/180

For Urbanized basins a minimum T_c of 5.0 minutes is required.

For non-urbanized basins a minimum T_c of 10.0 minutes is required

Total elapsed time: < 1 sec

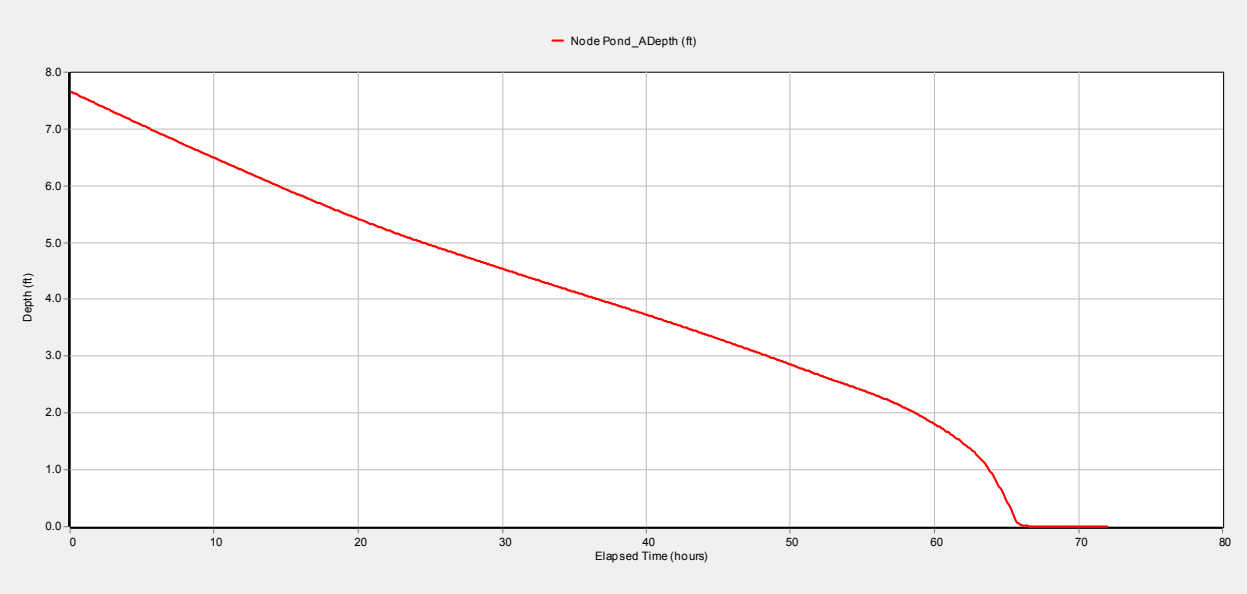
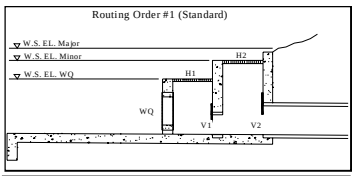
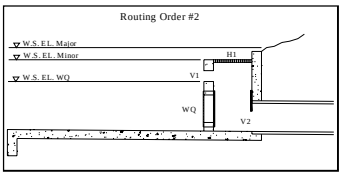
Onsite EURV + Offsite WQ

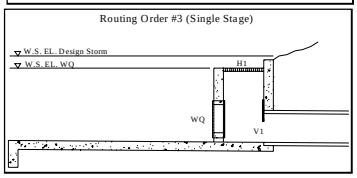


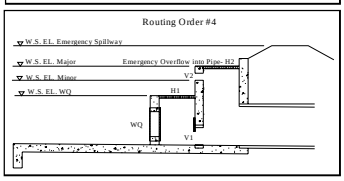
STAGE-DISCHARGE SIZING OF THE WEIRS AND ORIFICES (INLET CONTROL)

Project: Crest at Woodmen
Basin ID: Pond A









Current Routing Order is #3

Design Information (Input):

			#1 Horiz.	#2 Horiz.	#1 Vert.	#2 Vert.	
Circular Opening:	Diameter in Inches	Dia. =			54.00		inches
OR							
Rectangular Opening:	Width in Feet	W =	20.00				ft.
	Length (Height for Vertical)	L or H =	8.00				ft.
	Percentage of Open Area After Trash Rack Reduction	% open =	70		100		%
	Orifice Coefficient	C_o =	0.65		0.65		
	Weir Coefficient	C_w =	3.00				
	Orifice Elevation (Bottom for Vertical)	E_o =	6.10		-0.50		ft.

Calculation of Collection Capacity:

Net Opening Area (after Trash Rack Reduction)	A_o =	112.00		15.90	sq. ft.
OPTIONAL: User-Overide Net Opening Area	A_o =				sq. ft.
Perimeter as Weir Length	L_w =	44.00	ft.		
OPTIONAL: User-Overide Weir Length	L_w =		ft.		
Top Elevation of Vertical Orifice Opening, Top =				4.00	ft.
Center Elevation of Vertical Orifice Opening, Cen =				1.75	ft.

Routing 3: Single Stage - Water flows through WQCV plate and #1 horizontal opening into #1 vertical opening. This flow will be applied to culvert sheet (#2 vertical & horizontal openings is not used).

			Horizontal Orifices				Vertical Orifices

STAGE-DISCHARGE SIZING OF THE WATER QUALITY CAPTURE VOLUME (WQCV) OUTLET

Project: The Crest At Woodmen

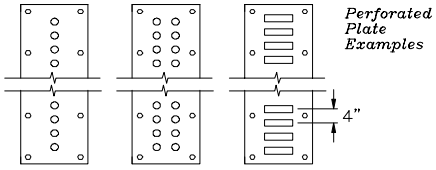
Basin ID: Pond B

WQCV Design Volume (Input):

Catchment Imperviousness, I_a =	68.3	percent			
Catchment Area, A =	34.52	acres	Diameter of holes, D =	2.875	inches
Depth at WQCV outlet above lowest perforation, H =	2.6	feet	Number of holes per row, N =	1	
Vertical distance between rows, h =	18.00	inches	**OR**		
Number of rows, NL =	3.00				
Orifice discharge coefficient, C_o =	0.65		Height of slot, H =		inches
Slope of Basin Trickle Channel, S =	0.010	ft / ft	Width of slot, W =		inches
Time to Drain the Pond =	40	hours			

Watershed Design Information (Input):

Percent Soil Type A =		%
Percent Soil Type B =	100	%
Percent Soil Type C/D =		%



Outlet Design Information (Output):

Excess Urban Runoff Volume (From 'Full-Spectrum Sheet')	0.27	watershed inches
	N/A	
Excess Urban Runoff Volume (From 'Full-Spectrum Sheet')	**2.632**	**acre-feet**
Outlet area per row, Ao =	18.74	square inches
Total opening area at each row based on user-input above, Ao =	6.49	square inches
Total opening area at each row based on user-input above, Ao =	0.045	square feet

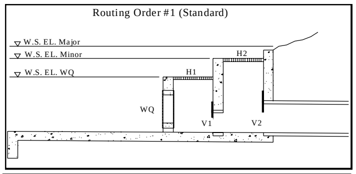
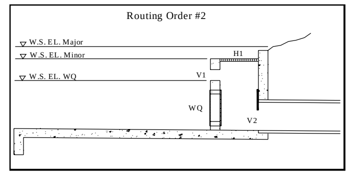
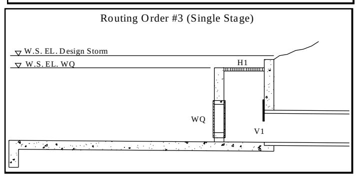
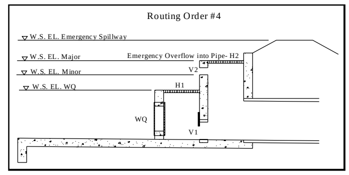
STAGE-DISCHARGE SIZING OF THE WEIRS AND ORIFICES (INLET CONTROL)

Project: Crest at Woodmen
Basin ID: Pond B









Current Routing Order is #3

Design Information (Input):

			#1 Horiz.	#2 Horiz.	#1 Vert.	#2 Vert.	
Circular Opening:	Diameter in Inches	Dia. =			54.00		inches
OR							
Rectangular Opening:	Width in Feet	W =	16.00				ft.
	Length (Height for Vertical)	L or H =	8.00				ft.
	Percentage of Open Area After Trash Rack Reduction	% open =	70		100		%
	Orifice Coefficient	C_o =	0.65		0.65		
	Weir Coefficient	C_w =	3.00				
	Orifice Elevation (Bottom for Vertical)	E_o =	5.12		-0.50		ft.

Calculation of Collection Capacity:

		#1 Horiz.	#2 Horiz.	#1 Vert.	#2 Vert.	
Net Opening Area (after Trash Rack Reduction)	A_o =	89.60		15.90		sq. ft.
OPTIONAL: User-Overide Net Opening Area	A_o =					sq. ft.
Perimeter as Weir Length	L_w =	38.40	ft.			
OPTIONAL: User-Overide Weir Length	L_w =		ft.			
Top Elevation of Vertical Orifice Opening, Top =				4.00		ft.
Center Elevation of Vertical Orifice Opening, Cen =				1.75		ft.

Routing 3: Single Stage - Water flows through WQCV plate and #1 horizontal opening into #1 vertical opening. This flow will be applied to culvert sheet (#2 vertical & horizontal openings is not used).

			Horizontal Orifices				Vertical Orifices			
Labels for WQCV, Minor, & Major Storage W.S. Elevations (input)	Water Surface Elevation ft (linked)	WQCV Plate/Riser Flow cfs (User-linked)	#1 Horiz. Weir Flow cfs (output)	#1 Horiz.
