RE: Stetson Ridge

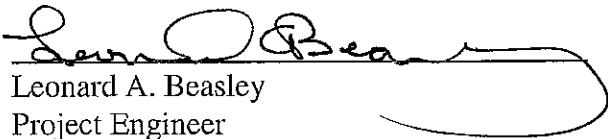

Dear Representative:

In accordance with the requirements of the City of Colorado Springs Subdivision Ordinance, a master development drainage plan has been prepared for the proposed Stetson Ridge development.

This plan has been prepared under the current City of Colorado Springs Drainage Criteria.

Seven (7) complete copies of the drainage report and plan are hereby transmitted for your review and approval. If there are any questions or comments concerning this report, please contact the undersigned.

Sincerely,

Leonard A. Beasley
Project Engineer

SIGNATURES AND STATEMENTS

Engineer's Statement:

The attached master development drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the City for master development drainage plans and said plan is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

David J. Whitehead, P.E. (Colo. 25118)

Developer's Statement:

The Developer has read and will comply with all the requirements specified in this master development drainage plan.

MASTER DEVELOPMENT DRAINAGE PLAN

Introduction:

Stetson Ridge is located in the east one-half of Section 17 and a portion of the east one-half of Section 8, Township 13 South, Range 65 West of the 6th P.M., El Paso County, Colorado Springs, Colorado. The property is bounded on the east by Marksheffel Road, on the south by Stetson Hills Boulevard (extended), and the northerly boundary is approximately one quarter of a mile south of Woodmen Road. Stetson Ridge contains approximately 480 acres and has a multi-use zoning and master plan approved by the City of Colorado Springs. The attached Proposed Conditions MDDP shows the various types of zoning within this development. The property is located within the Sand Creek Drainage Basin. The drainage basin fee for Sand Creek is \$6,714.00 per acre, \$400.00 per acre bridge fee, and the pond fee is \$427.00 for the land fee and \$1,498.00 for the facilities fee. This adds up to \$9,039.00 per acre combined fee for drainage, bridge and pond. The City has also indicated that this area may require a pond surcharge fee for Sky Sox Pond #2 of \$750.00 per acre. This is in and above the normal drainage, bridge and pond fees required for the site.

Soils:

The majority of the soils within this site consist of the Truckton Series. This soil is located on approximately 3/4 of the site. The other portion of the site within the northeast quarter consists of the Blakeland Series. Along the northwesterly edge of the property is a major drainage conveyance channel. This area also has a soil type from the Blakeland Series. These three types of soil are in Hydrologic Group A and B which has a permeability that is moderately rapid which gives it the Hydrologic Group A and B rating. These types of ratings will be used in the Existing Conditions Drainage Plan and a minimum of Group B rating will be used for the Proposed Conditions Drainage Plan.

Methodology:

The HEC-1 methodology was used for this project using a 2.6" precipitation depth for the 5-year event and 4.4" precipitation depth for the 100-year event. This methodology was used for areas in excess of 100 acres. For any basins or sub-basins less than 100 acres, the City/County criteria for the rational method was used as required by this criteria manual. The site contains approximately 480 acres.

Hydraulic Calculations

Pipe diameters, reinforce concrete box culvert dimensions, and channel sections were estimated with Haestad Methods, Inc. StormCad v1.0 software using the Manning's Formula, pertinent date sheets are included in the back of this report.

Street capacities were estimated using the City of Colorado Drainage Criteria manual graph of Discharge vs. Street Slope for collector streets (major and minor) and Flow Master 5.17 for irregular sections. The graph and data sheets are included in the appendix of this report.

It should be noted that the information in this report is preliminary in nature and shall be analyzed thoroughly in future drainage reports, based on final grading and street plans, etc.

Floodplain Statement

A portion of Stetson Ridge is located in a FEMA designated 100-year floodplain, as shown on F.I.R.M. Panel Number 08041C0537 F dated March 17, 1997.

Offsite Conditions:

Sand Creek, a major drainage conveyance channel, is located on the northwesterly boundary of this site. Runoff enters the site from this channel and also some runoff from properties to the northwest. This channel and areas are indicated on the attached Existing Conditions Drainage Plan as Sub-basin H. No other offsite flow enters this development.

Current Conditions:

This site was developed into seven major drainage basins with the majority of the basins draining to the west. A small portion drains to the east towards Marksheffel Road and another basin drains southerly into property adjacent on the south. Basin A drains southerly to the south boundary line of Stetson Ridge. This basin has an area of 81.91 acres and generates a peak flow of 21.2 cfs for the 5-year event and 50.4 cfs for the 100-year event. Flows exit this basin and development via an existing drainage channel that flows southerly and southwesterly to eventually connect with Sand Creek.

Basin B is located at the southwest portion of the development and contains 27.68 acres. The peak runoff generated from this basin is 6.6 cfs for the 5-year event and 15.6 cfs for the 100-year event. The majority of this runoff is collected from the offsite area to the west into an existing natural drainage channel that flows in a southerly direction. Flows are directed toward Stetson Hills. Based on the information obtained from the MDDP prepared for Stetson Hills, they are willing to accept these flows and the developed flows from this basin.

Basin C flows in a westerly direction to the proposed Ridgeview development. Runoff that is directed to that development indicate that these flows will be accepted by the Ridgeview development and conveyed westerly to the Sand Creek Drainage Channel. Existing condition flows that enter Ridgeview from Stetson Ridge are Sub-basins C1, C2 and C3. Sub-basin C1 generates a peak flow of 2.2 cfs for the 5-year event and 5.3 cfs for the 100-year event. This sub-basin contains 7.06 acres. Sub-basin C2 is the largest of the three and contains 67.17 acres and generates a peak flow of 17.5 cfs for the 5-year event and 41.8 cfs for the 100-year event. Sub-basin C3 is a small area and contains 4.39 acres. The runoff generated from this sub-basin is 1.8 cfs for the 5-year event and 4.2 cfs for the 100-year event. These flows are then conveyed through offsite sub-basin OS-C4 which contains 27.67 acres. The overall Basin C has an area of 106.29 acres and generates a peak flow of 17.0 cfs for the 5-year event and 91.0 cfs for the 100-year event.

Basin D is a small area located on the easterly edge of the site and runoff is directed easterly to two existing 30" C.M.P.s that direct runoff under Marksheffel Road. Basin D contains 17.67 acres and generates a peak flow of 6.4 cfs for the 5-year event and 15.3 cfs for the 100-year event. Basin E is also located on the easterly edge of the property and runoff is directed to two existing 30" R.C.P.s that convey flow under Marksheffel Road. Basin E contains 54.5 acres and generates a peak flow of 12.4 cfs for the 5-year event and 29.6 cfs for the 100-year event.

Basin F is a very small basin which contains 0.41 acres and is located on the easterly edge of the property. Runoff is directed in sheetflow westerly to the Ridgeview development. The peak flow generated from this basin is 0.2 cfs for the 5-year event and 0.5 cfs for the 100-year event.

Basin G was divided into four sub-basins of which three are within the Stetson Ridge development. Flows are directed westerly towards Ridgeview. Sub-basin G1 contains 77.81 acres and generates a peak flow of 19.8 cfs for the 5-year event and 47.3 cfs for the 100-year event. Flows exit Stetson Ridge via an existing drainage channel. Sub-basin G2 contains 101.24 acres and generates a peak flow of 16.0 cfs for the 5-year event and 82.0 cfs for the 100-year event. These flows exit Stetson Ridge and enter Ridgeview via an existing drainage channel. Sub-basin G3 contains 4.13 acres and generates a peak flow of 1.4 cfs for the 5-year event and 3.3 cfs for the 100-year event. Runoff is directed toward Ridgeview in sheetflow.

Basin H is located along the northwesterly portion of the site. Sub-basins H1, H4, H5 and H6 direct runoff in sheetflow to Sand Creek. Offsite Sub-basin H3 directs runoff to Sand Creek which also allows offsite flows to enter the Stetson Ridge development. Sub-basin H1 contains 2.04 acres and generates a peak flow of 0.8 cfs for the 5-year event and 2.0 cfs for the 100-year event. These flows are directed toward Sand Creek. Sub-basin H2 contains 0.71 acres and generates a peak flow of 0.3 cfs for the 5-year event and 0.8 cfs for the 100-year event. Flows are directed toward Sand Creek. Sub-basin OS-H3 contains 2.52 acres and generates a peak flow of 1.0 cfs for the 5-year event and 2.4 cfs for the 100-year event. Sub-basin H4 contains 3.94 acres, directs runoff to Sand Creek, and generates a peak flow of 1.5 cfs for the 5-year event and

3.6 cfs for the 100-year event. Sub-basin H5 contains 0.3 acres and generates a peak flow of 0.2 cfs for the 5-year event and 0.4 cfs for the 100-year event. Sub-basins H1, H2, OS-H3, OS-H4, and H5 are areas on the northerly side of Sand Creek and direct runoff to Sand Creek. Sub-basin H6 is located on the southerly side of Sand Creek and directs runoff to Sand Creek. The peak flow generated for this sub-basin which contains 53.95 acres is 13.7 cfs for the 5-year event and 32.5 cfs for the 100-year event. Runoff from Sub-basin H6 is directed to Sand Creek in sheetflow. Basin H contains 63.46 acres and generates a peak flow of 16.1 cfs for the 5-year event and 38.2 cfs for the 100-year event. These flows for existing conditions are based on the runoff directed and collected and then conveyed through this site via Sand Creek. This does not include any offsite upstream flows entering the site.

Developed Conditions:

Development of this site was divided into nine basins and eleven design points. The locations of basins designated on the attached Proposed Conditions Drainage Plan are delineated as A through I. The offsite basins that contribute flows to this site are indicated as OS prefix. Flows that exit the site into adjacent developments are also indicated with the OS prefix within that major basin delineation. Included with this drainage plan is a proposed storm drainage system, preliminary inlet sizing and pipe sizing, culverts necessary to convey runoff under the roadway, and the sizes of proposed ditches to safely convey runoff to pertinent outfall points.

Basin A was divided into five sub-basins. These sub-basins were dictated by existing ridge lines throughout the site and divisions of the proposed road network. Calculations were determined based on assumed slopes of the roads to determine the maximum capacity of these roadways. Flows match the maximum runoff allowed by the City criteria manual. Inlets were proposed to be installed and runoff conveyed underground to the appropriate outlet points. The peak flow generated in Basin A which contains 71.49 acres is 94.6 cfs for the 5-year event and 205.6 cfs for the 100-year event. These flows were determined by weighting the coefficient numbers based on the development being proposed within this basin. Basin A contains one design point which is shown on the attached Proposed Conditions MDDP as DP-1. DP-1 contains 35.02 acres and

generates a peak flow of 58.8 cfs for the 5-year event and 127.5 cfs for the 100-year event. The inlets and pipe system in Antelope Ridge Drive and Stetson Hills Boulevard will intercept and convey underground the 5-year flow. This system will convey underground 82.0 cfs of the 100-year flow, the remaining flow will pond at the low point in Stetson Hills Boulevard and be intercepted by inlets. Runoff will be directed to the 60" R.C.P. This 60" R.C.P. has the capacity to collect the 100-year flow of 206 cfs and has a maximum capacity of 236 cfs at a headwater depth of 8'.

Basin B was divided into two sub-basins. Sub-basin B1 is onsite and Sub-basin B2 is offsite. This offsite information was obtained from the Ridgeview MDDP proposed conditions drainage plan. Flows from Sub-basin B1 are directed to Stetson Hills Boulevard and then westerly to a proposed 48" R.C.P. which was included in the Ridgeview MDDP. This MDDP was prepared by URS-Greiner. Based on this plan, this development has sized this 48" R.C.P. to collect runoff from the Stetson Ridge development. Flows that exit Sub-basin B1 which contains 7.52 acres are 10.5 cfs for the 5-year event and 23.7 cfs for the 100-year event. Offsite sub-basin OS-B2 which is located on the northerly side of the proposed Stetson Hills Boulevard contains 15.60 acres and generates a peak flow of 22.2 cfs for the 5-year event and 50.0 cfs for the 100-year event. Runoff is directed to a proposed 48" R.C.P. which was included in the Ridgeview MDDP. Their MDDP includes runoff from Sub-basin B1. This proposed 48" R.C.P. has the capacity to intercept and convey the peak 100-year flow from Basin B of 70.2 cfs at a headwater depth of 4.2' and a minimum slope of 0.50%.

Basin C was divided into six sub-basins which are shown on the attached Proposed Conditions Drainage Plan. Sub-basins C1 and C4 direct runoff to a low point in a proposed roadway that runs in a north-south direction. Two inlets, 20'D-10Rs in a sump condition, are proposed at this location and flows will be conveyed underground via a 42" and 54" storm drain system to the future location of Peterson Road at a 2% slope. The capacity of those pipes are adequate to handle the developed flow from Sub-basins C1 and C4. Runoff will then continue in a westerly direction to the Ridgeview development. Sub-basins C2, C3, C5 and C6 will direct runoff to the

proposed roadway that runs in an east-west direction. Flows will be collected at the westerly boundary in two 20' D-10R inlets in a sump condition. The peak flow at this location for Basin C which contains 96.95 acres, is 121.0 cfs for the 5-year event and 256.7 cfs for the 100-year event. This system will connect to the future 60" storm drain that will convey runoff through the Ridgeview development and outlet into Sand Creek. The future 60" storm, based on preliminary analysis appears to have the capacity to collect the flows from Basin C in Stetson Ridge. Flows generated from Basin C are being accepted by the Ridgeview development and will be conveyed safely through their site to Sand Creek.

Basin D and E consist of Marksheffel Road flows only. Runoff is directed to a low point in Marksheffel Road and then to two existing 30" C.M.P.s. The area within Basin D is 6.20 acres and the peak flow generated is 21.8 cfs for the 5-year event and 41.1 cfs for the 100-year event.

Basin E contains 10.83 acres and generates a peak flow of 28.4 cfs for the 5-year event and 53.2 cfs for the 100-year event. This basin directs runoff to two existing 30" R.C.P.s and flows are then conveyed under Marksheffel Road in an easterly direction. Preliminary location of two future inlets are shown on Marksheffel Road. Location will be determined when Marksheffel Road, which is classified as a major arterial, is in its final design stage. No runoff from Stetson Ridge will be directed to Marksheffel Road.

Basin F is a small triangular piece located on the southerly portion of the site just south of Stetson Hills Boulevard. This area contains 3.51 acres and generates a peak flow of 5.3 cfs for the 5-year event and 11.9 cfs for the 100-year event. Flows from this basin are directed southeasterly to an existing drainage channel.

Basin G contains 17 sub-basins and eight design points. Sub-basins G1 through G9 and G16 direct runoff to Antelope Ridge Drive. Runoff is then directed westerly to Peterson Road and then continues westerly within a 78" storm drain to Sand Creek. The area at DP-7 is 81.96 acres and generates a peak flow of 79.5 cfs for the 5-year event and 172.5 cfs for the 100-year event.

Proposed inlets are anticipated along this roadway to pick up surface flow and convey it underground to this design point. The peak flow conveyed within this storm system at this point would be 106.0 cfs. Flows from this design point are directed within the storm drain system toward the Ridgeview development. Design points 8 and 9 are points along Antelope Ridge Drive to determine the size of the underground facility to collect and safely convey runoff from the sub-basins contributing flow to this area. DP-8 contains 81.40 acres and generates a peak flow of 99.9 cfs for the 5-year event and 213.3 cfs for the 100-year event. An underground pipe (42" R.C.P.) is proposed at this location which would safely convey underground 128.3 cfs. Flows then continue through this pipe and within Antelope Ridge Drive to a proposed east-west street that connects to Peterson Road. This intersection is shown on the attached Proposed Conditions Drainage Plan as DP-11. This design point collects flows from Sub-basins G1 through G9 and G12 through G16. DP-11 will require two 15' D-10Rs to collect surface flow and direct it to the proposed underground storm system. This 66" R.C.P. will continue westerly to a proposed 78" storm drain that will convey runoff to Sand Creek. This 66" R.C.P. has a pipe capacity of 362.7 cfs. At the intersection of the proposed Peterson Road, flows will be directed westerly to Sand Creek in a 78" storm drain which will have the capacity to safely convey flows from Basin G in Stetson Ridge. Basin G, which contains 229.45 acres, generates a peak flow of 157.0 cfs for the 5-year event and 399.0 cfs for the 100-year event. This system will connect to the future 78" storm drain that will convey runoff through the Ridgeview development and outlet into Sand Creek. The future 78" storm drain, based on preliminary analysis, appears to have the capacity to safely convey the flows from Basin G in Stetson Ridge. Flows generated from Basin G are being accepted by the Ridgeview development and will be conveyed safely through their site to Sand Creek.

Basin H will direct runoff to Sand Creek. The existing storm drainage conveyance channel that collects and conveys runoff through the northwesterly portion of this property. This major drainage conveyance channel flows in a southwesterly direction. The peak flow generated from Basin H which contains 64.65 acres is 66.6 cfs for the 5-year event and 149.3 cfs for the 100-year event. Shown within this major drainage conveyance channel are slope protection areas and drop

structures as recommended by the drainage basin planning study for Sand Creek. Also shown on Sand Creek is the limits of the FEMA floodplain area which has base flood elevations determined.

Basin I will direct runoff to the proposed Dublin Boulevard and then be conveyed westerly to Sand Creek. The peak flow generated from Basin I, which contains 7.44 acres, is 12.5 cfs for the 5-year event and 28.0 cfs for the 100-year event.

Proposed Improvements:

Planned development for this site to construct various types of development ranging from office space, park areas, commercial areas, single family residential, and multi family residential. This property does have an approved master plan for this area. The runoff calculations for this site were performed based on the area and type of development with related runoff coefficients. The calculations for these runoff flows are in the back of this report. This area is compatible for the type of development. The surface runoff will be conveyed through a series of underground storm drain system and culverts and directed to existing drainage conveyance channels. The overlot grading within this area should be anticipated to direct flow from all proposed structures through various side lot and rear lot swales and conveyed to the underground storm system, major drainage conveyance channels, or the roadway network. Preliminary details for the ditches, swales, and underground storm drain system and inlets, are shown on the attached Proposed Conditions Drainage Plan and in the back of this report. Runoff calculations for both the existing conditions and proposed conditions are in the back of this report.

Facilities:

Some of the facilities proposed for this site are not included within the drainage basin planning study for Sand Creek. Some improvements are included. At this time, it is felt that some of these major drainage improvements should be reimbursable items. The cost of public vs. private facilities will be discussed in greater detail at the time of the preliminary and final drainage report and plan stage.

Drainage Fees:

Stetson Ridge is located within the Sand Creek Drainage Basin. Currently, this is a drainage bridge and pond fee basin. Following is a breakdown of fees per acre for 2001. Also included within this area is the pond surcharge fee. This fee (if required) is \$714.00 per acre.

Drainage Fee (\$6,714.00/acre x 480)	\$3,222,720.00
Bridge Fee (\$400.00/acre x 480)	192,000.00
Pond Fee (Land - \$427.00/acre x 480)	204,960.00
Pond Fee (Facilities - \$1,498.00/acre x 480)	<u>719,040.00</u>
TOTAL (Drainage, Bridge & Pond Fee):	\$4,338,720.00
Pond Surcharge Fee (\$750.00/acre x 480)	<u>360,000.00</u>
TOTAL (with Surcharge Fee):	\$4,698,720.00

Proposed Drainage Facilities:

10' D10R (3 @ \$3,400.00/ea.)	\$10,200.00
12' D10R (1 @ \$3,900.00/ea.)	3,900.00
15' D10R (5 @ \$4,600.00/ea.)	23,000.00
20' D10R (14 @ \$5,300.00/ea.)	74,200.00
21" R.C.P. (350 L.F. @ \$29.00/ft.)	10,150.00
24" R.C.P. (1500 L.F. @ \$32.00/ft.)	48,000.00
30" R.C.P. (1100 L.F. @ \$40.00/ft.)	44,000.00
36" R.C.P. (3775 L.F. @ \$52.00/ft.)	196,300.00
42" R.C.P. (2325 L.F. @ \$59.00/ft.)	137,175.00
48" R.C.P. (1050 L.F. @ \$70.00/ft.)	73,500.00
54" R.C.P. (400 L.F. @ \$96.00/ft.)	38,400.00
60" R.C.P. (100 L.F. @ \$127.00/ft.)	12,700.00
66" R.C.P. (600 L.F. @ \$143.00/ft.)	85,800.00
Manholes (24 @ \$5,100.00/ea.)	<u>122,400.00</u>
Subtotal:	\$879,725.00
Engineering & Contingencies (15%):	<u>132,000.00</u>
TOTAL:	\$1,011,725.00

Proposed Sand Creek Improvements:

Located in Reach SC-7, Segments 148-1 and 148-2.

Six Grade Control Structures (650 L.F. @ \$170.00/ft.)	\$110,500.00
Select Rip-Rap Lining (2360 L.F. @ \$145.00/ft.)	<u>342,200.00</u>
Subtotal:	\$452,700.00
Engineering & Contingencies (15%):	<u>67,900.00</u>
TOTAL:	\$520,600.00

Drainage fees must be paid prior to recordation of plat. The owner will post the appropriate financial assurances to cover the cost of constructing these drainage improvements prior to the issuance of a building permit. Leigh Whitehead & Associates, Inc. cannot and will not guarantee that the actual construction cost will not vary from this estimate of probable costs for constructing these facilities.

Major Channel Improvements Phasing - Sand Creek:

The adopted Sand Creek Drainage Basin Planning Study recommends a selective channel improvement concept for Sand Creek. The study represents rip-rap bank lining at selected locations along with grade control structures. Development will be set back from the channel banks to reduce the possibility of property damage and allow a more natural channel. Areas of high bank velocity and the outside of curves will also require proper bank lining. The banks will be graded as necessary to provide a stable slope for rip-rap placement. Grade control structures will be placed across the channel at select locations to control long term erosion of the channel invert. The remainder of the channel will remain undisturbed in its natural state as open space, habitat and wetlands. Sand Creek channel has been divided into phases which will be constructed when an associated parcel is developed. Recommended phasing for improvements to Sand Creek Channel are as follows:

Basin H is located along the northerly portion of this site. This basin contains approximately 64.7 acres and planned development consists of low density, office development, and single

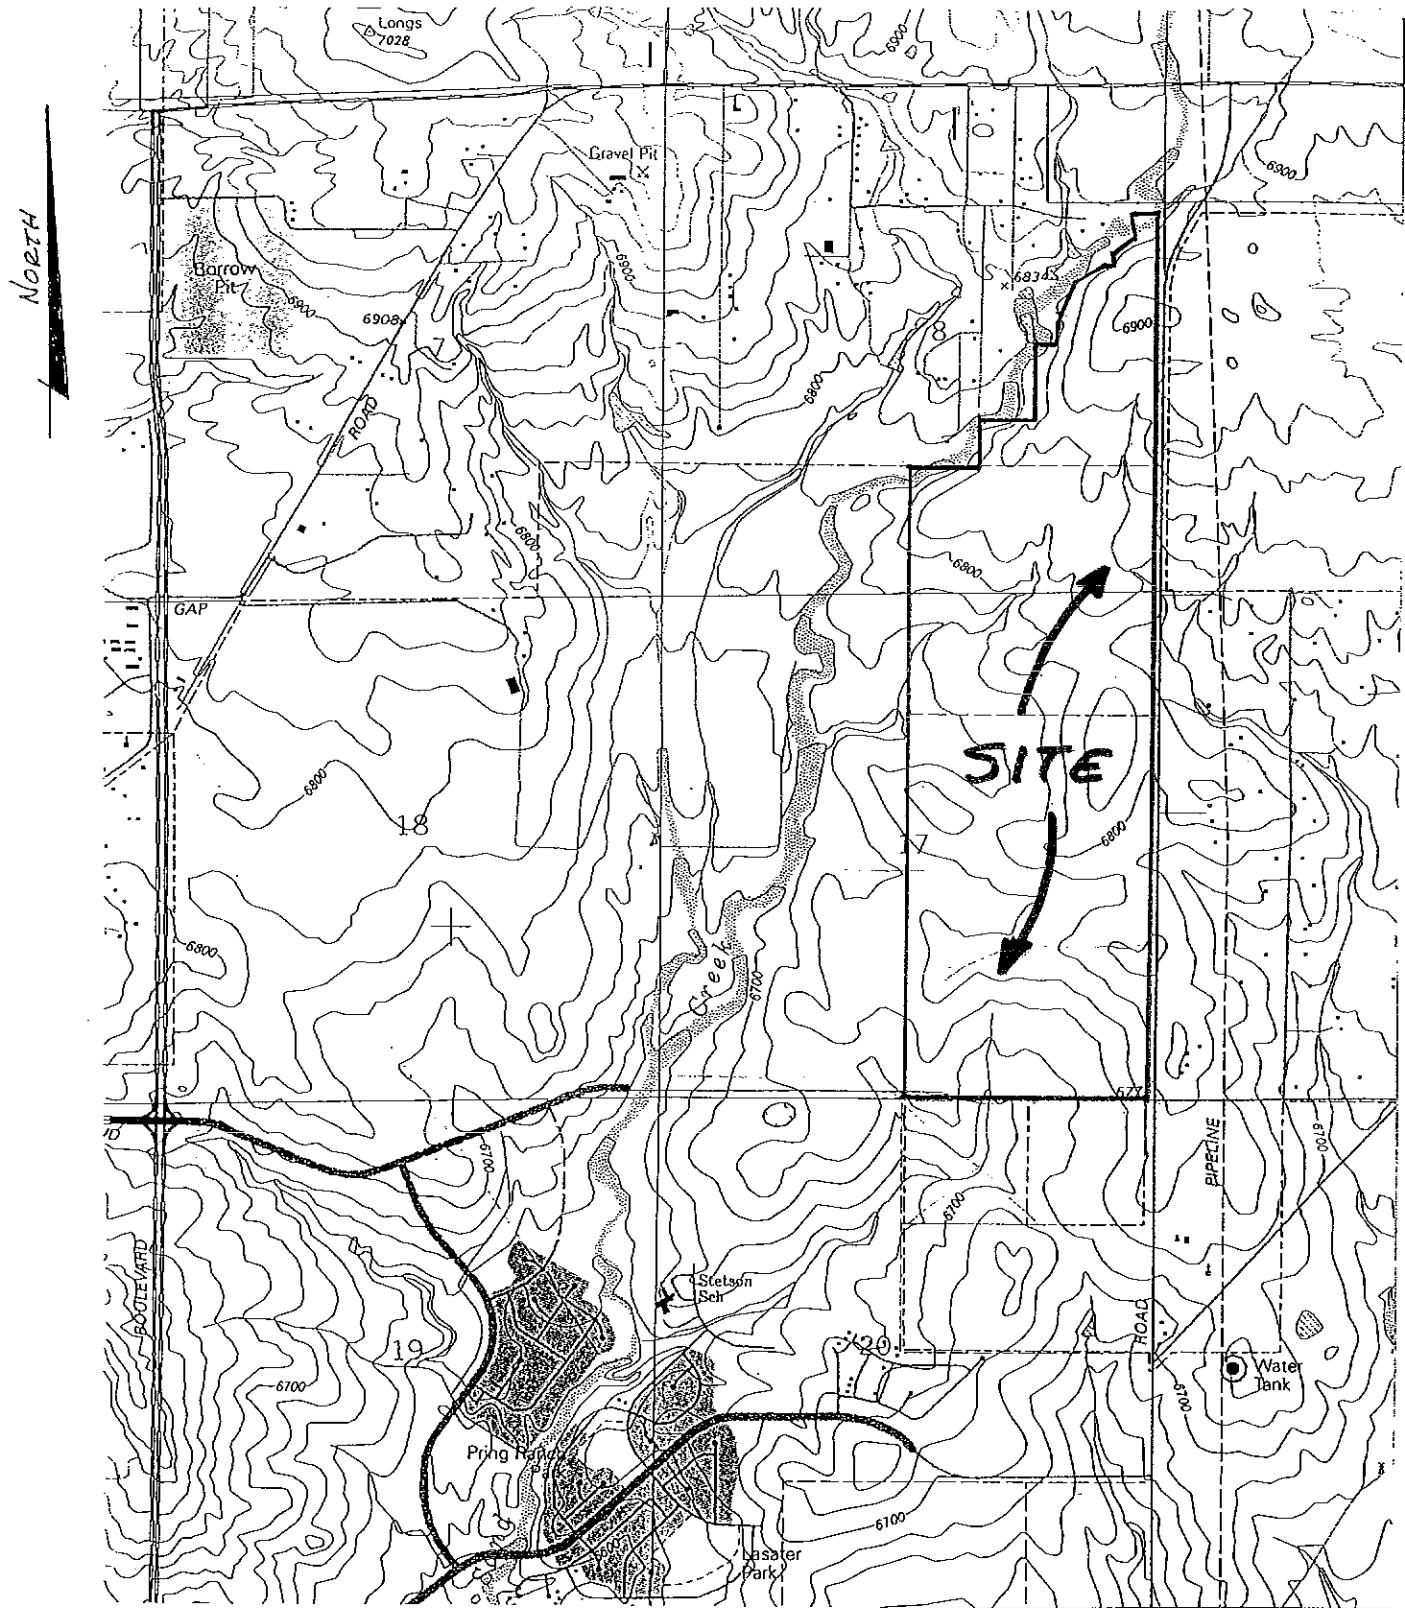

family residential use, and a park property. Runoff within this basin will be directed to Sand Creek. Estimated costs for improvements to Sand Creek are \$520,600.00. The drainage fee generated from Basin H would be approximately \$434,400.00. As the area develops, improvements to the Sand Creek channel will be the responsibility of the adjacent property owner. If the channel improvements exceed the drainage fee obligation, the owner/developer will receive credit for the overage. This overage will be reimbursed to the owner/developer from the Sand Creek drainage fund. Currently, it is unknown what the time frame for reimbursements are. This is dictated by previous reimbursement requests and available funds in the basin.

Basins A, C and G will require onsite storm drain systems. As development occurs in these basins, it will be necessary to evaluate the pertinent basin and determine what facilities (temporary or permanent) will be required to facilitate stormwater flows to their outlet locations. Phasing and implementation of these facilities will be determined by the preliminary/final drainage report when development occurs.

As mentioned previously, it is felt that some of the drainage facilities being recommended within this MDDP should be reimbursable items. These will be evaluated in greater detail when the Preliminary and Final Drainage Report and Plan are prepared. As a matter of information, the intent of the system is to collect the 100-year flow and safely convey it underground through the property to the west and outlet into Sand Creek. A majority of the system has been sized to handle the 100-year flow. Further, the proposed 60" storm drain and 78" storm drain within the Ridgeview Development has been recommended for reimbursement.

Summary:

This MDDP is part of the submittal requirement for the amendment to the master plan of this area. This MDDP is being submitted to the City of Colorado Springs Engineering Division. Construction of this development will not adversely affect this property or downstream facilities. With the proper design and construction of drainage facilities, it should safely convey storm runoff to appropriate outlet points.

LEGEND

SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD

- ZONE A** No base flood elevations determined.
- ZONE AE** Base flood elevations determined.
- ZONE AH** Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
- ZONE AO** Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- ZONE A99** To be protected from 100-year flood by Federal flood protection system under construction; no base elevations determined.
- ZONE V** Coastal flood with velocity hazard (wave action); no base flood elevations determined.
- ZONE VE** Coastal flood with velocity hazard (wave action); base flood elevations determined.

FLOODWAY AREAS IN ZONE AE

OTHER FLOOD AREAS

- ZONE X** Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.

OTHER AREAS

- ZONE X** Areas determined to be outside 500-year floodplain.
- ZONE D** Areas in which flood hazards are undetermined.

UNDEVELOPED COASTAL BARRIERS

Refer to the FLOOD INSURANCE RATE MAP EFFECTIVE DATE shown on this map to determine when actuarial rates apply to structures in zones where elevations or depths have been established.

To determine if flood insurance is available, contact an insurance agent or call the National Flood Insurance Program at (800) 638-6620.

## NOTES

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all planimetric features outside Special Flood Hazard Areas.

Coastal base flood elevations apply only landward of 0.0 NGVD, and include the effects of wave action; these elevations may also differ significantly from those developed by the National Weather Service for hurricane evacuation planning.

Areas of Special Flood Hazard (100-year flood) include Zones A, AE, AH, AO, A99, V, and VE.

Certain areas not in Special Flood Hazard Areas may be protected by flood control structures.

Boundaries of the floodways were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the Federal Emergency Management Agency.

Floodway widths in some areas may be too narrow to show to scale. Floodway widths are provided in the Flood Insurance Study Report.

This map may incorporate approximate boundaries of Coastal Barrier Resource System Units and /or Otherwise Protected Areas established under the Coastal Barrier Improvement Act of 1990 (PL 101-591).

Corporate limits shown are current as of the date of this map. The user should contact appropriate community officials to determine if corporate limits have changed subsequent to the issuance of this map.

For community map revision history prior to countywide mapping, see Section 6.0 of the Flood Insurance Study Report.

For adjoining map panels and base map source see separately printed Map Index.

## MAP REPOSITORY

## EFFECTIVE DATE(S) OF REVISION(S) TO THIS PANEL:

## ELEVATION DATUM

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations, referenced to the same datum. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, contact the National Geodetic Survey at the following address:

The Vertical Network Branch, NCG13  
National Geodetic Survey, NOAA

A map of a study area, likely a forest or park, divided into a grid of plots. The plots are numbered 1 through 10, with plot 1 at the top center, plot 2 below it, plot 3 to the right, plot 4 to the left, plot 5 at the bottom center, and plots 6 through 10 scattered throughout the lower half. A thick black line outlines a specific area, which is further subdivided into smaller plots labeled A through F. The background shows a dense network of roads and boundaries.

Zoning information is current through December 31, 1996.

The Official Zoning Map of the City is maintained in the Development Services Division and is available for inspection during business hours. Please be advised that copies of the Official Zoning Map are hereby stamped unoffical, should not be relied upon, and may not be used as evidence in legal proceedings. Current zoning districts are to take effect as of the official zoning map.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.  
 THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION  
 NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,  
 DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL    LOSS RATE:GREEN AND AMPT INFILTRATION  
 KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.  
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION  
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE, SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,  
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION  
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

---

Input Data

|                      |                |
|----------------------|----------------|
| Mannings Coefficient | 0.027          |
| Channel Slope        | 0.010000 ft/ft |
| Left Side Slope      | 3.000000 H : V |
| Right Side Slope     | 3.000000 H : V |
| Bottom Width         | 10.00 ft       |
| Discharge            | 224.00 cfs     |

---

---

Results

|                  |                       |
|------------------|-----------------------|
| Depth            | 2.01 ft               |
| Flow Area        | 32.23 ft <sup>2</sup> |
| Wetted Perimeter | 22.72 ft              |
| Top Width        | 22.06 ft              |
| Critical Depth   | 2.03 ft               |
| Critical Slope   | 0.009714 ft/ft        |
| Velocity         | 6.95 ft/s             |
| Velocity Head    | 0.75 ft               |
| Specific Energy  | 2.76 ft               |
| Froude Number    | 1.01                  |

---

Flow is supercritical.

Section "B-B"  
Cross Section for Trapezoidal Channel

---

**Project Description**

Project File      c:\engineering\haestad\academic\fmw\98079a.fm2  
Worksheet        G10 & G17 Channel  
Flow Element     Trapezoidal Channel  
Method           Manning's Formula  
Solve For        Channel Depth

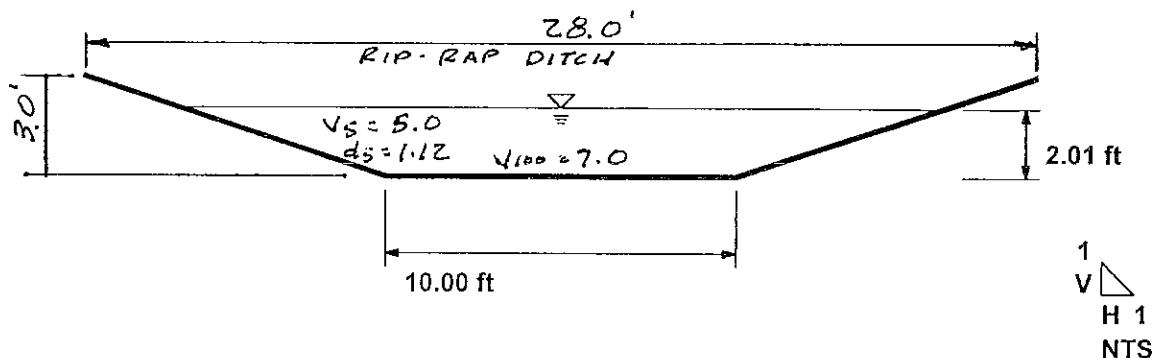

---

---

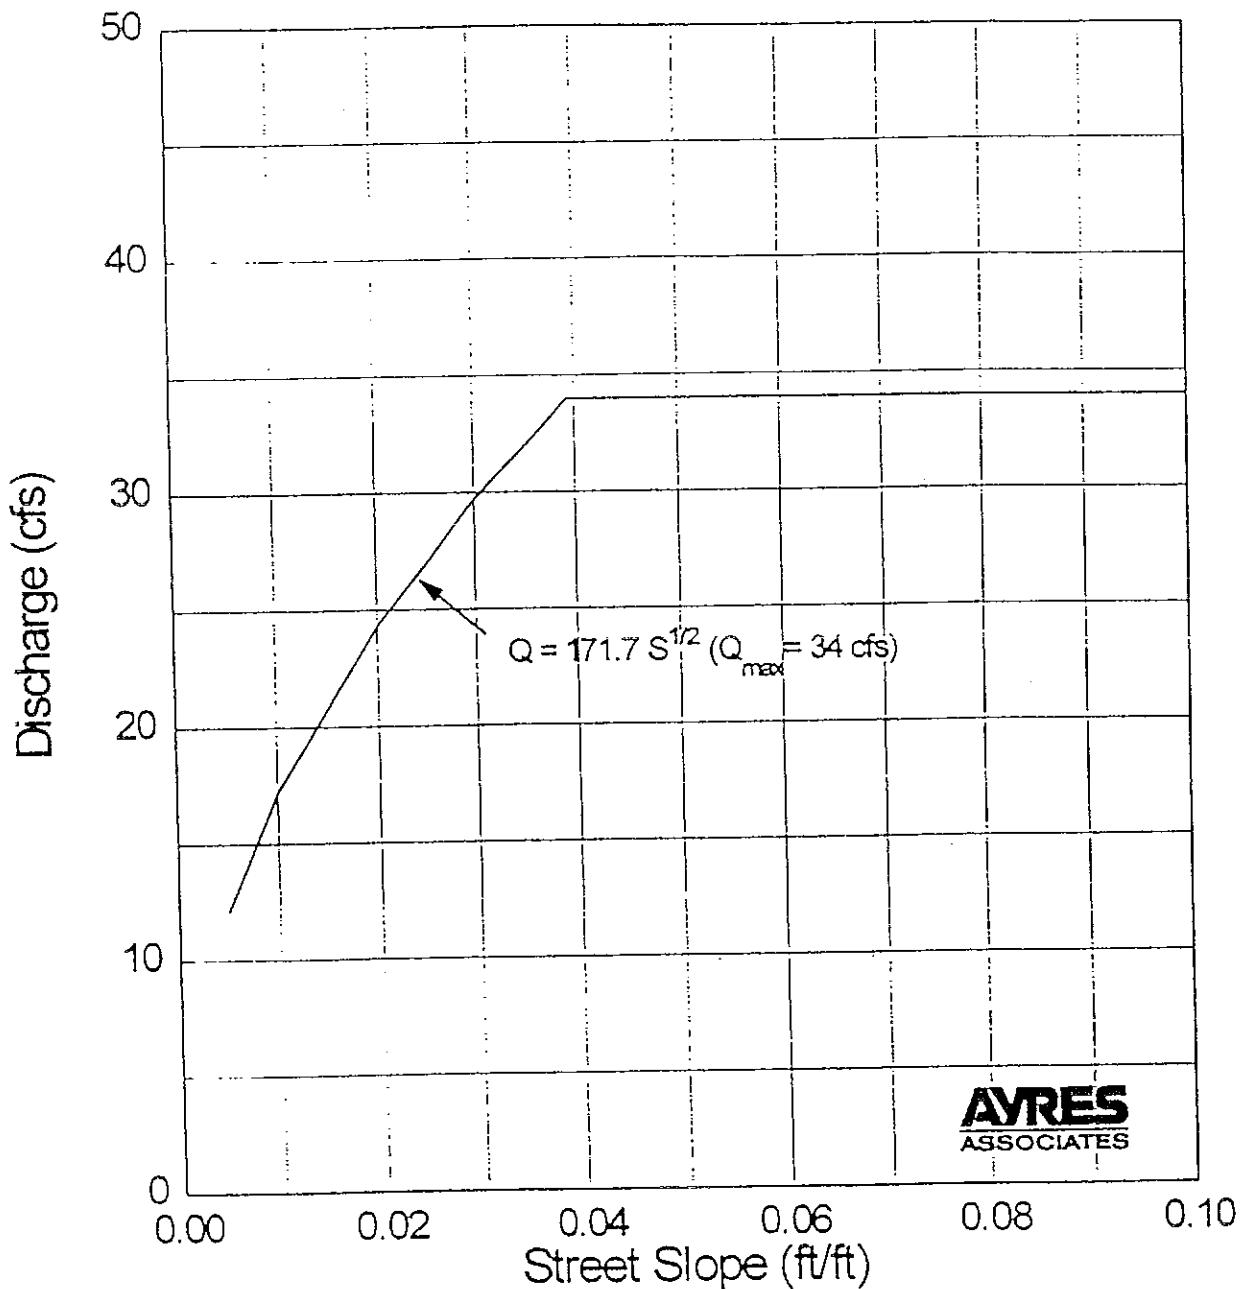

**Section Data**

Mannings Coefficient    0.027  
Channel Slope           0.010000 ft/ft  
Depth                    2.01      ft  
Left Side Slope        3.000000 H : V  
Right Side Slope       3.000000 H : V  
Bottom Width            10.00     ft  
Discharge              224.00    cfs

## COLLECTOR STREETS (Major and Minor)

Interim Release October 12, 1994  
City of Colorado Springs

Use this graph to determine the allowable street capacity per side, initial storm, for the typical street section using a 2% crown. No flow may cross the crown.
